

The cocotex.dtx Package

**A modular package suite for
automatic, flexible typesetting**

Version 0.4.1

(2024/03/23)

Lupino

lupino@le-tex.de

Table of contents

Introduction	vii
1 Basic concepts	vii
1.1 Types, Inheritance and Abstract Containers	vii
1.2 Complex Components	vii
2 How to Read This Documentation	viii
2.1 Keyword Colors	viii
2.2 Data Types of Properties	viii
2.3 Types of Components	viii
 Module 1 cocotex.dtx	 3
1 Hard-coded requirements	3
2 Class Options	3
3 Class Hook	4
4 Internal Requirement	5
5 Loading and Adjusting Underlying DocumentClass	5
5.1 General Typography	5
6 Loading other CoCoTeX Modules	6
6.1 coco-accessibility	6
6.2 coco-script	6
6.3 coco-headings	6
6.4 coco-floats	7
6.5 coco-title	7
6.6 coco-notes	7
7 Further Hard Dependencies	7
7.1 Index	7
7.2 Hyperref	7
8 End of Document Class Hook	8
 Module 2 coco-kernel.dtx	 9
1 Preamble	9
1.1 Hard dependencies	9
1.2 Package Options	9
2 Exception handlers	9
3 Global Switches	10
4 Containers	11
5 Components	14
5.1 Simple Components	14
5.2 Counted Components	17
6 Hooks	22
7 Properties	23
7.1 Setting Properties	23
7.2 Using Properties	24
7.3 Processing Instructions	25
7.4 Property Conditionals	25
8 Helper macros	25
8.1 Handling of Optional Arguments	26
8.2 Iterators	26

8.3	Attributes	26
8.4	Style Classes	29
8.5	The CoCoTeX Logo	30
Module 3 coco-common.dtx		31
1	Package options	31
1.1	Accessibility Features	31
2	Commonly Used Low-Level Macros and Registers	32
2.1	Hard Dependencies	32
2.2	Common Variables	32
2.3	Helper macros	33
2.4	Masks	33
2.5	Arithmetics	34
2.6	Determine actual page number	35
3	Re-Thinking L ^A T _E X Core Functions	36
3.1	Keeping .aux-Files Up-to-Date	36
3.2	Content lists	37
3.3	Indentation and Left Margins of Potentially Numbered Items	39
3.4	Labelling and Cross referencing	43
3.5	Linguistic Name generation and selection	44
3.6	Link Generation	44
Module 4 coco-accessibility.dtx		47
1	LaTeX code	47
1.1	General Processing	47
1.2	Activating and Deactivating Accessibility Features	48
1.3	Accessibility-specific additions	48
1.4	Generic Macro to Declare Accessibility Features	50
1.5	Lua injection	53
1.6	Hyperlink handling	54
1.7	Tagging Page Styles as Artifacts	55
1.8	generic artifacts	56
1.9	Tagging for Floats	56
1.10	Transformation of Typographic Unicode characters	57
1.11	Automatic PDF Tagging	58
1.12	Default Role Mapping	58
2	Lua code	58
2.1	Local Variables and Tables	58
2.2	Meta Data Extraction	59
2.3	Public Methods	59
Module 5 coco-meta.dtx		61
1	Counted Container Handlers	61
1.1	Generic Blocks	61
1.2	Contributor Roles	62
2	Labeled Components	64
3	Meta Data Rolemaps for Tagged PDFs	64
4	Common Meta Data	65
4.1	Affiliations	66
Module 6 coco-headings.dtx		71
1	Facility for declaring heading levels and their layouts	71
1.1	Initializers for New Heading Levels	79
1.2	Initializers for Instances of Heading Levels	79
2	Externalisation of Heading Components	80
2.1	Common Stuff	80

2.2	Table of Contents Entry	80
2.3	Facility to create the running title macros	81
2.4	Facility to create PDF bookmarks	82
3	Rendering the Headings	82
3.1	Inline Headings	82
3.2	Block Headings	83
4	The Heading environment	83
4.1	Environment Macros	83
4.2	Content Handlers	84
5	Defaults	86
6	Miscellaneous	92
6.1	Alternative paragraph separation	92

Module 7 coco-notes.dtx 95

Module 8 coco-script.dtx 101

1	Default fallback font	101
2	Generic Fonts Declaration Mechanism	102
3	Predefined script systems	103
3.1	Support for Armenian script	103
3.2	Support for Chinese script	103
3.3	Support for Japanese script	103
3.4	Support for Hebrew script	103
3.5	Support for Arabic script	104
3.6	Support for Greek script	104
3.7	Support for Ethiopian/Amharic script	104
3.8	Support for Syrian script	105
3.9	Support for medieval scripts and special characters	106

Module 9 coco-title.dtx 107

1	Top-Level Interface	107
2	Processing of PDF Meta Data	109
2.1	Processing of the Document's Title	110
2.2	Processing of the Document's Author	110
2.3	Processing of the PDF's Creator, Producer, and Keywords Meta Data	111
2.4	Including the XMP Meta Data	111
3	Intermediate Level Interfaces	112
3.1	Funds, Grants, and Supporters	113
3.2	Simple Component Declarations	113
4	Default Settings	115
5	Accessibility Features	120
5.1	Output Intent and ICC Profiles	120
5.2	Encoding of the PDF-A Conformance	121
5.3	Titlepage Specific Role Maps	122

Module 10 coco-floats.dtx 123

1	Package Setup	123
1.1	Hard requirements	123
1.2	Adjustments at the Beginning of the Document	124
1.3	Document Class-Option Overrides	124
1.4	Internal Registers	125
2	Internal macros	126
2.1	Generic resetter	126
2.2	Wrapper for L ^A T _E X's Native float Environments	127
3	The Generic float Container	127
3.1	Common Float Components	128

3.2	Common Float Properties	129
3.3	The Generic float Environment	134
3.4	The SubFloat Environment	135
3.5	Attribute Handlers	137
3.6	Handling of List-of Entries	138
3.7	Label and Referencing mechanisms.....	140
3.8	Processing the Float.....	141
3.9	Caption mechanism	143
4	Generic User-Level Float Containers.....	145
5	Image Containers	147
5.1	Abstract Graphics Container	147
5.2	Floating Figure Container	147
5.3	Figure Output Routines	148
5.4	Inline Figures.....	148
6	Table Containers.....	150
6.1	The Abstract Tabular Container	150
6.2	The User-Level Table Container	150
6.3	The Table Output Handler	151
7	Other Float-Related Macros	152
Module 11 coco-frame.dtx		153
1	Top-Level Interface.....	153
2	Cropmark printer	153
Module 12 coco-lists.dtx		157
1	Preamble	157
1.1	Package Options	157
2	The List Container	158
2.1	List Properties.....	158
2.2	List Components	161
3	Declaring List Types	162
4	Declare Lists.....	162
4.1	The List Environment.....	165
4.2	Unpacking the List Type-Specific Handlers	167
5	Default List Types	168
5.1	Unnumbered Lists.....	168
5.2	Numbered Lists	169

Tag Index.....		182
Attribute Index.....		183

Introduction

1 Basic concepts

The core concept of the CoCoTeX Framework to view typographical objects, such as floats, headings, title pages, etc., as closed units that contain a fixed set of elements that determines the exact nature of each occurrence. For a heading, such elements may be the heading’s title, an optional subtitle, a counter or a list of authors responsible for the section that is introduced by the heading.

In CoCoTeX those typographical units are called *Containers*, the elements inside a Container are called *Components*. The occurrence of a Container in a specific TeX document is an *Instance* of that Container.

The exact realization of a Container is done in local style files with so-called *Properties*; short snippets of TeX code that tell the LaTeX interpreter how the Components in the Instances of Containers are to be read, processed and eventually rendered.

Typically, Containers are LaTeX environments that contain the Components in the form of TeX macros that in turn take as their mandatory argument the value for the Component in that specific Instance of the Container. Most Containers follow an *read first – process later* approach, i.e., the LaTeX interpreter reads the whole content of the environment and the processing is done at the `\end` macro of the corresponding environment.

1.1 Types, Inheritance and Abstract Containers

Components and Properties are both (*data-*)*Types* specific to an Container. A Container can be abstract, meaning that the container is not directly used in an end-user’s tex file, but serves as blueprint for other, user-level, Containers. As such, Containers can *inherit* the Types (i. e., the Properties and Components) of another Container. Containers that inherit Types from other Containers are called *Sub-* or *Child-Containers*, the inherited Container is called a *Parent Container*.

Containers are therefore somewhat comparable to *classes* in object-oriented programming languages, an Instance of a Container can be seen as an *object* (i. e., an Instance of a Class). Components are then object variables, while Properties take the place of *class variables* and/or *class methods*, depending on how exactly a Property is implemented. Sometimes, a Property holds only a simple value, while another Property may contain a complex set of instructions or even calls to other Properties.

1.2 Complex Components

Components can also be more complex than simple data storage devices. Usually, a Component occurs only once in a Container, say, for instance there can be only one (main) title in each heading.

Other Components may occur more than once in the same Container instance, e. g. a chapter (which itself may be a Sub-Container of the abstract Parent Container Heading) may have more than one Author. Such Components are called *Group Components*. They are usu-

ally realized as LaTeX environments within a Container’s environment and contains in itself Components. Those second-level Components are called *Counted Components*, as they are “numbered” across all Group Component instances within the same Container Instance. For each Group Component, there is another Container-unique *Collection Component*, in which all instances of a Group Component are collected during processing. How this collection is put together is controlled by a special *Collection Property*.

2 How to Read This Documentation

The documented source code is printed in red code boxes with line numbers referring to lines in the corresponding unpacked .sty files:

29 This is the documented source code

Code and usage examples are printed in blue boxes:

This is a {\LaTeX} example.

2.1 Keyword Colors

Certain Parts of this documentation are color-coded:

Containers are orange,
Hooks are green,
Components are blue,
Properties are purple,

PDF-Tags are cyan
Attributes are dark green
L^AT_EX-Macros are le-tex red

2.2 Data Types of Properties

Whenever a Property is declared, the documentation contains a list of expected values for that property. The following list gives an overview over the various expected data types:

<dimen>	means that the Property is expected to return a dimensional value (or “length”) or a dimension register.
<skip>	means that the Property is expected to return a skip, i. e., a L ^A T _E X dimension with or without glue, or a skip register.
<num>	means that the Property is expected to return a number or counter register.
<CS token>	means that one previously defined control sequence token (i. e., a L ^A T _E X macro) is expected.
[word1 word2]	indicates that either exact word1 or word2 is expected. This notation may also contain other fixed data types, and more than one option could be given.
<name>	means that the name of a specific Component, Property or Container is expected. Details are usually in the description.
<any>	means that the Property can take any value.

2.3 Types of Components

LC	means that the Component is a Labeled Component
CC	means that the Component is a Counted Component
GC	means that the Component is a Group Component
CL	means that the Component is a Collection Component
OR	means that the Component is an Override

One more driver function

22 `<*driver>`

If we want to run the splitted development dtx locally, this macro prevents undefined control sequence errors and actually includes the dtx chunks.

23 `\def\includeDTX#1{\input src/#1.dtx}`

End driver function

24 `</driver>`

Module 1

cocotex.dtx

```
<*class>
```

This is the main class file for the CoCoT_EX Framework.

File Preamble

```
23 %%
24 %% Common document class for \textit{xerif} projects.
25 %%
26 %% Maintainer: p.schulz@le-tex.de
27 %%
28 %% lualatex - texlive > 2019
29 %%
30 \NeedsTeXFormat{LaTeX2e}[2018/12/01]
31 \ProvidesClass{cocotex}
32 [2024/03/23 0.4.1 cocotex]
```

1 Hard-coded requirements

```
33 \RequirePackage{kvoptions-patch}
34 \RequirePackage{xkeyval}
```

2 Class Options

Passing options down to the L^AT_EX standard packages

```
35 \DeclareOptionX{main}{\PassOptionsToPackage{\CurrentOption}{babel}}
36 \DeclareOption{es-noindentfirst}{\PassOptionsToPackage{es-noindentfirst}{babel}}
37 \DeclareOption{es-noshorthands}{\PassOptionsToPackage{es-noshorthands}{babel}}
38 \PassOptionsToPackage{shorthands=off}{babel}
```

The option `pubtype` (short for “publication type”) has possible four values: `mono`, `collection`, `journal`, and `article`. `mono` (also the default when no `pubtype` is given) and `collection` are used to switch between single and multiple contributor documents; `collection` and `journal` to switch between one-time text collections and periodicals, respectively. All three types implicitly load the L^AT_EX standard class `book`.

`collection` is used when the document’s components (i. e., chapters) are contributed by different authors like collections or proceedings. `journal` is used for collections where each contribution is accompanied by a myriad of meta data. `mono` stands for monographs, i.e., whole books that are written by the same author(s).

The publication type `article` is intended for single articles of a journal. It loads the L^AT_EX standard class `article`.

```

39 \newif\ifcollection \collectionfalse
40 \newif\ifarticle \articlefalse
41 \newif\ifmonograph \monographfalse
42 \newif\ifjournal \journalfalse
43 \define@choicekey{cocotex.cls}{pubtype}[\cc@pub@type\nr]{collection,article,journal,mono}{%
44   \ifcase\nr\relax% collection
45     \global\collectiontrue
46   \or% article
47     \global\articletrue
48   \or% journal
49     \global\journaltrue
50   \else% monograph
51     \global\monographtrue
52   \fi
53 }
54 \DeclareOptionX*{\PassOptionsToClass{\CurrentOption}{article}}
55 \DeclareOptionX*{\PassOptionsToClass{\CurrentOption}{book}}

```

Passing options down to various CoCoT_EX modules:

```

56 \DeclareOptionX{debug}{\PassOptionsToPackage{\CurrentOption}{coco-kernel}}
57 \DeclareOptionX{a11y}{\PassOptionsToPackage{init}{coco-accessibility}}
58 \DeclareOptionX{lang-id}{\PassOptionsToPackage{\CurrentOption}{coco-accessibility}}
59 \DeclareOptionX{nodetree}{\PassOptionsToPackage{\CurrentOption}{coco-accessibility}}
60 \DeclareOptionX{showspaces}{\PassOptionsToPackage{\CurrentOption}{coco-accessibility}}
61 \DeclareOptionX{no-spaces}{\PassOptionsToPackage{\CurrentOption}{coco-accessibility}}
62 \DeclareOptionX{no-paras}{\PassOptionsToPackage{\CurrentOption}{coco-accessibility}}
63 \DeclareOptionX{no-compress}{\let\cc@no@pdf@compression\relax}
64 \DeclareOptionX{color-enc}{\PassOptionsToPackage{\CurrentOption}{coco-common}}
65 \DeclareOptionX{usescript}{\PassOptionsToPackage{\CurrentOption}{coco-script}}
66 \DeclareOptionX{nofigs}{\PassOptionsToPackage{\CurrentOption}{coco-floats}}
67 \DeclareOptionX{ennotoc}{\PassOptionsToPackage{\CurrentOption}{coco-notes}}
68 \DeclareOptionX{endnotes}{\PassOptionsToPackage{\CurrentOption}{coco-notes}}
69 \DeclareOptionX{resetnotesperchapter}{\PassOptionsToPackage{\CurrentOption}{coco-notes}}
70 \DeclareOptionX{endnotesperchapter}{\PassOptionsToPackage{\CurrentOption}{coco-notes}}
71 \ProcessOptionsX

```

3 Class Hook

`\ccAfterClassHook` Almost all user level macros have been renamed when CoCoT_EX became independent from `xerif`. In order to ensure backwards-compatibility, we define a hook that holds aliases from the old names to the new ones. Those are defined in the `coco-xerif` module (which is *not* part of CoCoT_EX itself, but included in `xerif`'s common files). The hook is expanded at the very end of the `cocotex.cls` file. The `coco-xerif` module itself is loaded early in `coco-common.sty`.

Note that this hook is temporary. As soon as all legacy styles are adjusted to the new macro names, this hook will be removed!

```

72 \def\ccAfterClassHook{}

```

`\ccToggleCountedConditionalsHook` is a hook to ensure backwards-compatibility within the processing of Counted Components

Note that this hook is temporary. As soon as all legacy styles are adjusted to the new macro names, this hook will be removed!

```
73 \def\ccToggleCountedConditionalsHook{%
```

4 Internal Requirement

```
74 \RequirePackage{coco-common}
```

5 Loading and Adjusting Underlying DocumentClass

All publication types supported by CoCoTeX are based on one of L^AT_EX's default classes `book` or `article`:

```
75 \ifarticle
76   \LoadClass[10pt,a4paper]{article}
77 \else
78   \LoadClass[10pt,a4paper]{book}
79 \fi
```

5.1 General Typography

Offsets are the removed to make all values relative to the upper left corner of the page to ease maintainance.

```
80 \voffset-1in\relax
81 \hoffset-1in\relax
```

Automatted typesetting needs some room to play

```
82 \emergencystretch=2em
```

and strong restrictions:

```
83 \frenchspacing
84 \clubpenalty10000
85 \widowpenalty10000
```

Empty Pagestyle

Page style without any headers or footers

```
86 \def\ps@empty{%
87   \let\@oddhead\@empty
88   \let\@evenhead\@empty
89   \let\@oddfoot\@empty
90   \let\@evenfoot\@empty
91 }
```

Vacancy Pages

Vacancy pages in general need to have page style `empty`:

```

92 \def\cleardoublepage{\clearpage\if@twoside \ifodd\c@page\else
93   \hbox{}\thispagestyle{empty}\newpage\if@twocolumn\hbox{}\newpage\fi\fi}

```

Book Parts

re-defined to make front- and backmatter components distinguish-able

```

94 \ifarticle\else
95   \newif\if@frontmatter \@frontmatterfalse
96   \renewcommand\frontmatter{%
97     \cleardoublepage
98     \@mainmatterfalse
99     \@frontmattertrue
100    \pagenumbering{arabic}}
101   \renewcommand\mainmatter{%
102     \cleardoublepage
103     \@frontmatterfalse
104     \@mainmattertrue}
105   \renewcommand\backmatter{%
106     \cleardoublepage
107     \@mainmatterfalse
108     \@frontmatterfalse}
109 \fi

```

WARNING!
The following section is
deprecated and will be
changed or deleted in
future releases.

```

110 \usepackage{soul}

```

6 Loading other CoCoT_EX Modules

6.1 coco-accessibility

We load the accessibility module always, even if we don't end up actually using it.

```

111 \RequirePackage{coco-accessibility}

```

6.2 coco-script

Inclusion of the script module which also loads the babel package

```

112 \ifLuaTeX
113 \RequirePackage{coco-script}
114 \else
115 \RequirePackage{babel}
116 \fi

```

6.3 coco-headings

```
117 \RequirePackage{coco-headings}
```

6.4 coco-floats

Inclusion of the float module

```
118 \RequirePackage{coco-floats}
```

6.5 coco-title

Inclusion of the title page module

```
119 \RequirePackage{coco-title}
```

6.6 coco-notes

Inclusion of the end-/footnotes module

```
120 \RequirePackage{coco-notes}
```

Fallback, in case, `coco-headings.sty` is not loaded for some reason.

7 Further Hard Dependencies

7.1 Index

Some more hard dependencies:

```
121 \RequirePackage{index}
122 \makeindex
```

7.2 Hyperref

```
123 \RequirePackage{hyperref}
```

Finally, some `hyperref` settings (TODO: check, which of those are better placed inside the local publisher's styles)

```
124 \hypersetup{%
```

first, we want links to be breakable

```
125 breaklinks%
```

and the table of contents not to be automatically linked, as this causes problems with the `ltpdfa` package and we add the links via the `coco-common` module, anyways.

```
126 ,linktoc=none%
```

pdf borders are controlled via the coco-frame module, if necessary

```
127 ,pdfborder={0 0 0}%
```

The next option causes hyperref to calculate the encoding of DocumentInfo and other direct-to-PDF data (bookmarks, etc.) automatically

```
128 ,pdfencoding=auto%
```

Bookmarks are numbered by default.

```
129 ,bookmarksnumbered=true%
130 }
```

Disables PDF compression when the `no-compress` document option is set.

```
131 \ifx\cc@no@pdf@compression\relax
132 \ifx\pdfobjcompresslevel\@undefined
133 \edef\pdfobjcompresslevel{\pdfvariable objcompresslevel}%
134 \fi
135 \pdfcompresslevel=0
136 \pdfobjcompresslevel=0
137 \fi
```

8 End of Document Class Hook

Expanding backwards-compatibility aliases from the coco-xerif module:

```
138 \ccAfterClassHook
```

```
</class>
```

Module 2

coco-kernel.dtx

```
<*kernel>
```

This file provides the object-oriented interfaces for all other CoCoT_EX modules.

1 Preamble

```
23 \NeedsTeXFormat{LaTeX2e}[2018/12/01]
24 \ProvidesPackage{coco-kernel}
25 [2024/03/23 0.4.1 cocotex kernel]
```

1.1 Hard dependencies

```
26 \RequirePackage{kvoptions-patch}
27 \RequirePackage{xkeyval}
28 \RequirePackage{etoolbox}
```

1.2 Package Options

The `debug` option triggers the output of additional information messages to the shell.

```
29 \newif\ifcc@debug \cc@debugfalse
30 \DeclareOption{debug}{\global\cc@debugtrue}%
```

The `prefix` option will be explained below in Sect. 3.

```
31 \DeclareOptionX{prefix}[]{\gdef\cc@prefix{#1}}%
32 \ProcessOptionsX
```

2 Exception handlers

The CoCoT_EX kernel provides some macros to unify exception handling. There are four levels of output: `error`, `warning`, `info`, and `debug`.

`\ccPackageError` creates an error message specific to the Framework.

`{#1}` is the module
`{#2}` is the type of error

{#3} is the immediate error message
 {#4} is the help string

```

33 \def\ccPackageError#1#2#3#4{%
34   \GenericError{%
35     (#1)\@spaces\@spaces\@spaces\@spaces
36   }{%
37     [CoCoTeX #1 #2 Error] #3%
38   }-#{#4}%
39 }
```

`\ccPackageWarning` is a macro to create warnings specific to the Framework.

{#1} is the module
 {#2} is the type of error
 {#3} is the immediate warning message

```

40 \def\ccPackageWarning#1#2#3{%
41   \GenericWarning{%
42     (#1)\@spaces\@spaces\@spaces\@spaces
43   }{%
44     [CoCoTeX #1 \if!#2!\else#2 \fi Warning] #3%
45   }%
46 }
```

`\ccPackageInfo` is a macro to create shell output specific to the Framework.

{#1} is the module
 {#2} is the type of message
 {#3} is the immediate info string

```

47 \def\ccPackageInfo#1#2#3{%
48   \GenericInfo{%
49     (#1)\@spaces\@spaces\@spaces\@spaces
50   }{%
51     [CoCoTeX #1\if!#2!\else\space#2\fi] #3%
52   }%
53 }
```

While the macros defined above are meant to be used in all CoCoTeX modules, the following is only for the Kernel.

`\ccKernelDebugMsg` prints a debug message if and only if the `debug` package option is set.

{#1} is the debug message

```

54 \def\ccKernelDebugMsg#1{\ifcc@debug\message{[CoCo Kernel Debug]\space\space#1^^J}\fi}
```

3 Global Switches

`\ccPrefix` is the prefix that is added to Component macros and (some) Container environments.

This has mostly historic reasons: back when CoCoTeX was specific to the *xerif* typesetting automaton, all macros produced by the xml converter had a `tp` prefix (from `transpect`, the XML conversion tool in the backend of *xerif*). After CoCoTeX became stand-alone, the `tp` prefix became obsolete, but the converters running at the time needed to be backward-compatible. Therefore, all *xerif*-bound CoCoTeX instances still set this macro to ensure user-level macros bear the `tp`-prefix.

```
55 \ifx\ccPrefix\@undefined\edef\ccPrefix{\cc@prefix}\fi
56 \ccPackageInfo{Kernel}{Info}{The macro prefix is now `~\ccPrefix'.}
```

`\ifcc@is@final` is a boolean switch that indicates whether or not a process is final. This is mainly used in the accessibility module where it matters if a macro is actually used to print stuff, or if it is just processed.

```
57 \newif\if@cc@is@final \@cc@is@finalfalse
58 \AtBeginDocument{\@cc@is@finaltrue}
```

`\ccWhenAlly` is a stub that eats its argument. It only does stuff when the `coco-accessibility` package is loaded, which we cannot know, yet.

```
59 \let\ccWhenAlly\@gobble
```

`\ccIfAll` the same, but it takes two arguments, one for the *true* case and a second for the *false* case. We default to the *else* case, so we always gobble the first argument. This will be altered if the `coco-accessibility` package is loaded later.

```
60 \let\ccIfAlly\@gobble
```

`\ifcc@modern` is a switch to distinguish older versions of the L^AT_EX Kernel from newer versions. The pivot date is defined to be 2020/06/01.

```
61 \ifx\IfFormatAtLeastTF\undefined
62   \providecommand\IfFormatAtLeastTF{\@ifl@t@r\fmtversion}%
63 \fi
64 \newif\if@cc@modern
65 \IfFormatAtLeastTF{2020/06/01}{\@cc@moderntrue}{\@cc@modernfalse}
```

4 Containers

Containers are the package's core data structure. They are basically sets of properties that are processed in the same way.

`\ccDeclareContainer` is the constructor for new Containers.

{#1} is the Container's name

{#2} is its body, which consists of Inheritance instructions, Type and Env declarations.

```
66 \def\cc@warning@spaces{\space\space\space\space\space\space\space\space\space\space\space\space\space\space\space\space\space\space\space\space\space\space\space\space\space\space\space\space\space\space\space\space\space\space\space\space\space\space}%
67 \long\def\ccDeclareContainer#1#2{%
68   \ifcsdef{cc@container@#1}
69     {\ccPackageWarning{Kernel}{-}{Re-declaring Container `#1' ^^J}
70 \cc@warning@spaces All Type settings up to this point will remain!}}
71   {\csdef{cc@container@#1}{}}%
72   \csdef{cc@cur@cont}{#1}%
```

We want the declarator macros to be only allowed inside the `\ccDeclareContainer` macro.

```
73 \begin{group}
```

`\ccInherit` The inherit mechanism is dynamic, i.e., we can load multiple type declarations from multiple containers at once.

`{#1}` is a comma-separated list of Types that should be inherited

`{#2}` is a comma-separated list of Container names which the Types should be inherited from

```
74 \def\ccInherit##1##2{\cc@inherit{##1}{##2}{#1}}%
```

`\ccDeclareType` Each Container is defined by the data types it provides. These data types are declared with this macro.

`{#1}` is the name of the data type

`{#2}` is code that is specific to this type, usually something like Component or Property declarations, handlers, and so forth

```
75 \long\def\ccDeclareType##1##2{\csgappto{cc@type@##1@#1}{##2}}%
```

`\ccDeclareEnv` Each container usually is realised as a \LaTeX environment. The `\ccDeclareEnv` macro is used to set up this environment. Usually, the environment has *the same name as the Container*.

`[#1]` overrides the environment's name. However, keep in mind that the Container's name is not changed by re-naming the corresponding environment.

`{#2}` is used for the stuff done at the environment's beginning

`{#3}` is the stuff done at the environment's end

In the `begin` part, the Types declared in the Container declaration's body should be evaluated using the `\ccEvalType` macro, see below.

```
76 \def\ccDeclareEnv{\@ifnextchar [{\cc@declare@env}{\cc@declare@env[#1]}}%
77 \def\cc@declare@env[#1]##2##3{%
78 \csgdef{\ccPrefix #1}{\global\let\reserved@cont\cc@cur@cont\def\cc@cur@cont{#1}##2}%
79 \csgdef{end\ccPrefix #1}{##3}\global\let\cc@cur@cont\reserved@cont}%
```

The body of the Container is expanded outside the local group. That way the user can define the Container globally using the locally defined macros above.

```
80 \def\x{%
81 #2%
82 }%
83 \expandafter\x\endgroup
84 }
```

`\ccSetContainer` is used to change the currently active (Sub-)Container.

`{#1}` is the name of the new active Container

```
85 \def\ccSetContainer#1{\def\cc@cur@cont{#1}}
```

`\ccAddToType` add additional content (i.e., the next token) to a Type `{#1}` of a previously declared Container `{#2}`.

```
86 \def\ccAddToType#1#2{\csgappto{cc@type@#1@#2}}
```

`\ccEvalType` calls the declaration list for Data Type `{#2}`. With optional `[#1]`, the Type's Container name can be overridden locally.

```
87 \def\ccEvalType{\cc@opt@curcont\cc@eval@type}
88 \def\cc@eval@type[#1]#2{%
89 \expandafter\ifx\csname cc@type@#2@#1\endcsname\relax
90 \ccPackageError{Kernel}{Class}
```

```

91 {Data Type #2 in Container #1 undefined!}
92 {You try to evaluate a data type `#2' from container `#1', but that data type has not been
    declared.}%
93 \else
94   \ccKernelDebugMsg{Evaluating cc@type@#2@#1:^^J \csmeaning{cc@type@#2@#1}}%
95   \csname cc@type@#2@#1\endcsname
96 \fi
97 }

```

`\ccCheckParent` checks if a Container `{#1}` is declared so that another Container `{#2}` can inherit.

```

98 \def\ccCheckParent#1#2{%
99   \expandafter\ifx\csname cc@container@#1\endcsname\relax
100   \ccPackageError{Kernel}{Class}
101   {Parent Container `#1' undeclared}
102   {You tried to make a Container named `#2' inherit from a Container named `#1', but a
    Container with that name does not exist.\MessageBreak
103   Please make sure that parent Containers are declared before their descendents.}%
104 \else
105   \csgdef{cc@parent@#2}{#1}%
106 \fi
107 }

```

`\cc@inherit` is the low-level inherit function.

`{#1}` is a comma-separated list of things to be inherited

`{#2}` is the Container-list that should be inherited from

`{#3}` is the name of the inheriting Container

```

108 \def\cc@inherit#1#2#3{\cc@parse@inherit #1,,\@nil #2,,\@nil #3\@@nil}

```

`\cc@parse@inherit` is a low-level function to recursively parse the parameters of the `\cc@inherit` macro, above.

```

109 \def\cc@parse@inherit #1,#2,\@nil #3,#4,\@nil #5\@@nil{%
110   \let\next\relax
111   \if!#1!\else
112     \if!#3!\else

114       \def\@argii{#2}\def\@argiv{#4}%
115       \ifx\@argii\@empty
116         \ifx\@argiv\@empty\else
117           \def\next{\cc@parse@inherit #1,,\@nil #4,\@nil #5\@@nil}%
118         \fi
119       \else
120         \ifx\@argiv\@empty
121           \def\next{\cc@parse@inherit #2,\@nil #3,,\@nil #5\@@nil}%
122         \else
123           \def\next{%
124             \cc@parse@inherit #1,,\@nil #4,\@nil #5\@@nil
125             \cc@parse@inherit #2,\@nil #3,#4,\@nil #5\@@nil
126           }%
127           \fi\fi\fi\fi
128   \next}

```

`\cc@do@inherit` is the macro that actually causes inheritance.

`{#1}` is the name of a Type

`{#2}` is the name of the Container that Type `{#1}` is *inherited* from

`{#3}` is the name of the Container that *inherits* Type `{#1}`

```

129 \def\cc@do@inherit#1#2#3{%
130   \ccKernelDebugMsg{#3 inherits #1 from #2.}%
131   \ccCheckParent{#2}{#3}%
132   \expandafter\ifx\csname cc@type@#1@#2\endcsname\relax
133     \ccPackageError{Kernel}{Type}{Type `#1' was not declared}{Type `#1' was not declared for
       Container `#2'.}%
134   \else
135     \edef\x{\noexpand\csgappto{cc@type@#1@#3}}%
136     \expandafter\expandafter\expandafter\x\expandafter\expandafter\expandafter{\csname cc@type@
       #1@#2\endcsname}%
137     \ccKernelDebugMsg{value cc@type@#1@#3:^^J \expandafter\meaning\csname cc@type@#1@#3\
       endcsname}%
138   \fi
139 }

```

5 Components

5.1 Simple Components

“Simple Components” are basically data storages. They are used within Containers to obtain data and store them for further processing at the end of the Container, or even beyond.

`\ccDeclareComponent` defines a simple Component macro. The internal macro that is used to store the Component’s value is `\csname cc@<current Container name>@<#1>\endcsname`.

- `[#1]` is the Component’s identifier. If omitted, `{#1}` is the same as `{#2}`.
- `{#2}` is the Component’s name
- `{#3}` is code that is executed *before* assignment of the user’s value
- `{#4}` is code that is executed *after* assignment of the user’s value

```

140 \def\ccDeclareComponent{\cc@opt@second\cc@declare@comp}
141 \def\cc@declare@comp[#1]#2#3#4{%
142   \ltx@LocalExpandAfter\global\expandafter\let\csname cc@\cc@cur@cont @#1\endcsname\relax
143   \expandafter\long\expandafter\def\csname \ccPrefix#2\endcsname##1{%
144     #3\expandafter\long\expandafter\def\csname cc@\cc@cur@cont @#1\endcsname{##1}\ignorespaces
       #4}%
145 }

```

`\ccDeclareGlobalComponent` is a shortcut to declare simple, globally available Components with the name `{#2}` and an optional initial value `[#1]`. They are usually empty.

```

146 \def\ccDeclareGlobalComponent{\cc@opt@empty\cc@declare@global@comp}%
147 \def\cc@declare@global@comp[#1]#2{%
148   \ccDeclareComponent{#2}{\expandafter\global}{}%
149   \if!#1!\else\csname \ccPrefix #2\endcsname{#1}\fi%
150 }

```

Once declared, a component can be set in two ways: The first way is to use `\ccPrefix<name>` with one argument for its value. The second, preferred, way is to use the `\ccComponent` macro:

`\ccComponent` is the preferred way to fill a Component with content.

- `{#1}` is the Component’s name
- `{#2}` is the Instance value.

```

151 \long\protected\def\ccComponent#1#2{%
152   \ifx\cc@is@counted\relax
153     \ifcsdef{cc@\cc@cur@cont @#1}{%
154       {\cc@def@counted@comp{\cc@counted@comp@scheme{#1}}{#1}{}}}%
155     \csgdef{cc@\cc@cur@cont @\cc@counted@comp@scheme{#1}}{#2}%
156   \else
157     \ifcsdef{cc@\cc@cur@cont @#1}{\ccDeclareComponent{#1}{}}}%
158     \csdef{cc@\cc@cur@cont @#1}{#2}%
159   \fi
160 }

```

`\ccComponentEA` is a variant of `\ccComponent` but it expands the Content in `{#2}` once before it is assigned to the Component `{#1}`.

```

161 \long\protected\def\ccComponentEA#1#2{%
162   \def\x{\ccComponent{#1}}\expandafter\x\expandafter{#2}%
163 }

```

`\ccUseComp` is a high level command to return (or print) the material stored as a Component with the name `{#1}`.

```

164 \def\ccUseComp#1{\csname cc@\cc@cur@cont @#1\endcsname}

```

`\ccdefFromComp` is a user-level command to store the value of a Component `{#2}` into a CS token `{#1}`.

```

165 \def\ccdefFromComp#1#2{\cc@store@comp{e}#1{#2}}

```

`\ccgdefFromComp` is the global variant of `\ccdefFromComp`.

```

166 \def\ccgdefFromComp#1#2{\cc@store@comp{x}#1{#2}}

```

`\strip@longprefix` is a helper macro to strip the prefix from the `\meaning` of a `\long` macro.

```

167 \def\strip@longprefix#1\long macro:->#2{#2}

```

`\cc@store@comp` is a generalized macro to store a component's unexpanded internal definition in a TeX macro.

`{#1}` is a scope quantifier (either 'e' or 'x')

`{#2}` is a CS token

`{#3}` is the name of a component

```

168 \long\def\cc@store@comp#1#2#3{%
169   \edef\@tempa{\expandonce{\csname protected@#1def\endcsname}\noexpand#2}%
170   \protected@edef\@tempb{\csname cc@\cc@cur@cont @#3\endcsname}%
171   \ifx\@tempb\relax
172     \let#2\relax
173   \else
174     \expandafter\@tempa\expandafter{\@tempb}%
175   \fi
176 }

```

`\ccUseComponentFrom` is a high level command to return (or print) the material stored as a global Component from the Container `{#1}` with the name `{#2}`.

```

177 \def\ccUseComponentFrom#1#2{\csname cc@#1@#2\endcsname}

```

`\ccGetComp*` is a user-level command to return the contents stored in a Component of name `{#1}` as a paragraph iff the Component is neither empty nor `\relax`. If Accessibility features are activated, the returned content of the Component is automatically tagged with a `Para` tag.

The starred version of `\ccGetComp` suppresses automated tagging for that Component when the accessibility features are active.

```
178 \def\ccGetComp{\@ifstar\cc@sget@comp\cc@get@comp}
179 \def\cc@get@comp#1{\ccWhenComp{#1}{%
180   \ccWhenAlly{\ccaStructStart{Para}}%
181   \ccUseComp{#1}%
182   \ccWhenAlly{\ccaStructEnd{Para}}%
183   \par}}
184 \def\cc@sget@comp#1{\ccWhenComp{#1}{\ccUseComp{#1}\par}}
```

`\ccIfComp` is a high level macro that executes `{#2}` if the Component macro `{#1}` is used in a Container (empty or non-empty), and `{#3}` if not.

```
185 \long\def\ccIfComp#1#2#3{\expandafter\ifx\csname cc@\cc@cur@cont @#1\endcsname\relax#3\else#2\fi
}
```

`\ccWhenComp` is a high level variant of `\ccIfComp` that omits the `else`-branch.

`{#1}` is the name of the Component

`{#2}` is code that is expanded when the Component `{#1}` is used in a container (empty or non-empty)

```
186 \long\def\ccWhenComp#1#2{\expandafter\ifx\csname cc@\cc@cur@cont @#1\endcsname\relax\else#2\fi}
```

`\ccUnlessComp` is a high level variant of `\ccIfComp` that omits the `then`-branch.

`{#1}` is the name of the Component

`{#2}` is the code that is expanded when a Container `{#1}` is *not* used in a Container (neither empty nor non-empty)

```
187 \long\def\ccUnlessComp#1#2{\expandafter\ifx\csname cc@\cc@cur@cont @#1\endcsname\relax#2\fi}
```

`\ccIfCompFrom` is the global variant of `\ccIfComp`.

`{#1}` is the name of the Container

`{#2}` is the name of the Component

`{#3}` is the then-branch

`{#4}` is the else-branch

```
188 \long\def\ccIfCompFrom#1#2#3#4{\expandafter\ifx\csname cc@#1@#2\endcsname\relax#4\else#3\fi}
```

`\cc@long@empty` is a helper macro used as comparator when checking whether a `\long` macro is empty or not.

```
189 \long\def\cc@long@empty{}
```

`\ccIfCompEmpty` is a high level macro that executes `{#2}` if the Component macro `{#1}` is empty (or `{}`) within its Container, and `{#3}` if it is either not existent or non-empty.

```
190 \long\def\ccIfCompEmpty#1#2#3{\expandafter\ifx\csname cc@\cc@cur@cont @#1\endcsname\
cc@long@empty#2\else#3\fi}
```

`\ccIfCompFromEmpty` is a global variant of `\ccIfCompEmpty`.

`{#1}` is the name of the Container

`{#2}` is the name of the Component
`{#3}` is the then-branch
`{#4}` is the else-branch

```
191 \long\def\ccIfCompFromEmpty#1#2#3#4{\expandafter\ifx\csname cc@#1@#2\endcsname\cc@long@empty#3\
    else#4\fi}
```

`\cc@check@empty` handles the distinction between empty and un-used components: First, check if `#4#3` is set (i. e., anything but `\relax`). If it is set, check if it is empty. If empty, set `#4#3` to `\relax`, meaning further occurrences of `\ccIfComp{#4#3}` will execute the `else` branch. If `#4#3` is non-empty, do nothing.

If `#4#3` is already `\relax`, check if the fallback `#1#3` is set. If so, make `#4#3` an alias of `#1#3`. If not, do nothing.

`[#1]` is the prefix of the fallback component
`{#2}` is the Container name
`{#3}` is the name of the Component
`{#4}` is the Override's prefix

```
192 \def\cc@check@empty{\cc@opt@empty\cc@check@empty}%]
193 \def\cc@check@empty[#1]#2#3#4{%
194   \ccIfComp{#4#3}
195   {\ccIfCompEmpty{#4#3}
196     {\expandafter\global\expandafter\let\csname cc@#2@#4#3\endcsname\relax}
197     {}}
198   {\ccIfComp{#1#3}
199     {\expandafter\expandafter\expandafter\let\expandafter\csname cc@#2@#4#3\expandafter\
200       endcsname\csname cc@#2@#1#3\endcsname}
201     {}}}
```

5.2 Counted Components

Counted Components are Components that may occur in the same parent Container multiple times. They may be multiple instances of single-macro Components, or recurring collections of multiple Components, called **Component Groups**.

Component Groups

`\ccDeclareComponentGroup` is a user-level macro to declare a new Component Group with the name `{#1}` and the body `{#2}`.

```
201 \def\ccDeclareComponentGroup#1#2{%
202   \csnumgdef{cc#1Cnt}{\z@}%
203   \csdef{\ccPrefix#1}{\cc@opt@empty{\csname cc@group@#1\endcsname}}%
204   \csdef{cc@group@#1}{##1}%
205   \def\cc@cnt@grp{cc#1}%
206   \csxdef{cc#1Cnt}{\expandafter\the\expandafter\numexpr\csname cc#1Cnt\endcsname+\@ne\relax}%
207   \if!##1!\else\csgdef{cc@cc@cur@cont @#1-\csname cc#1Cnt\endcsname @attrs}{##1}\fi
208   #2%
209   \csname @#1@hook\endcsname
210 }%
211 \csdef{end\ccPrefix#1}{\ccToggleCountedConditionals\cuse{cc@compose@group@#1}}%
212 }
```

`\ccDeclareGroupHandler` is used to declare a new group handler. A Group Handler is a hook for code `{#2}` that is expanded at the end of a Component Group `{#1}`'s environment. It is mostly used to process Components within a Group instance and store the result in their own components. For instance, a Group Handler can be used to combine a First Name and a Surname to a combined Component "FullName".

```

213 \def\ccDeclareGroupHandler#1#2{%
214   \ifcsdef{cc@group@#1}
215     {\ifcsdef{cc@compose@group@#1}
216       {\csgappto{cc@compose@group@#1}{#2}}
217       {\csgdef{cc@compose@group@#1}{#2}}}
218     {\ccPackageError{Kernel}{Type}{Component Group `#1' unknown!}{You tried to declare a Group
219       Handler for a Component Group that has not been declared, yet! Use \string\
        ccDeclareComponentGroup{#1}{} to declare the Component Group first.}}%

```

`\cc@cnt@grp` is a designated group name. Counted Components of the same group use the same counter.

```

220 \let\cc@cnt@grp\@empty

```

`\ccUseCompByIndex` picks a Component with name `{#3}` and index `{#2}` from a group `{#1}`.

```

221 \def\ccUseCompByIndex#1#2#3{\csname cc@\cc@cur@cont @#1-#3-#2\endcsname}

```

`\ccUsePropFrom` picks a Counted Component with the index `{#2}` from a Group `{#1}` and renders it using Property `{#3}`.

```

222 \def\ccUsePropFrom#1#2#3{%
223   \begingroup
224   \@tempcnta\numexpr#2\relax
225   \letcs\ccTotalCount{cc#1Cnt}%
226   \def\cc@cnt@grp{cc#1}%
227   \ccToggleCountedConditionals
228   \csnumdef{cc#1Cnt}{\the\@tempcnta}%
229   \ccCurCount=\the\@tempcnta\relax%
230   \csname cc@\cc@cur@cont @#3\endcsname%
231   \endgroup}

```

Iterating over Component Groups

The following two macros iterate over all instances of a Component Group `{#1}` in the current Container and applies for each instance the Property `{#2}`. The result is appended to the the Collector Component `{#3}`, if and only if that Component is not yet set for the current Container at the time of the first iteration.

While the first macro only writes the Property *definition* into the Collector Component, the second fully expands the macros inside the Property and stores the result in Component #3.

Use the former to print and the latter to further process the respective results.

`\ccCurCount` stores the number of the current instance of a Counted Component. Use this in the declarations of Properties that are expanded within the Component Group.

```

232 \newcount\ccCurCount

```

`\cc@assign@res` assigns the result of the Component collection to a control sequence with the name `{#1}` and resets the temporary storage.

```

233 \def\cc@assign@res#1{%
234   \ifx\cc@iterate@res\relax
235     \cslet{#1}\relax
236   \else
237     \expandafter\csname #1\expandafter\endcsname\expandafter{\cc@iterate@res}%
238   \fi

```

```

239 \global\let\cc@iterate@res\relax
240 }

```

`\ccIfComponentOverride` is a switch to apply either `{#2}`, if the Collection Component `{#1}` has been set manually within a container; or `{#3}`, if it has been generated from Counted Components.

```

241 \def\ccIfComponentOverride#1#2#3{\expandafter\ifx\csname cc@used@#1@override\endcsname\@empty#2\
    else#3\fi}

```

`\ccComposeCollection` is used to create an unexpanded Collection Component `{#3}` from all instances of Component Group `{#1}` using the instructions given by property `{#2}`.

```

242 \def\ccComposeCollection#1#2#3{%
243   \ccIfComp{#3}{\cslet{cc@used@#3@override}\@empty}{%
244     \ifcsdef{cc#1Cnt}{%
245       \expandafter\ifnum\csname cc#1Cnt\endcsname > \z@\relax
246       \edef\cc@iterate@res{%
247         \noexpand\bgroup
248         \noexpand\def\noexpand\ccTotalCount{\csname cc#1Cnt\endcsname}%
249         \noexpand\ccToggleCountedConditionals
250         \noexpand\def\noexpand\cc@cnt@grp{cc#1}}%
251       \expandafter\@tempcntb=\csname cc#1Cnt\endcsname\relax
252       \cc@iterate{\@tempcnta}{\@one}{\@tempcntb}{%
253         \edef\@tempb{%
254           %% top-level counter for user interaction
255           \noexpand\ccCurCount=\the\@tempcnta
256           %% evaluating group attributes
257           \ifcsdef{cc@\cc@cur@cont @#1-\the\@tempcnta @attrs}{\noexpand\ccParseAttributes{#1-\
258             the\@tempcnta}{\csname cc@\cc@cur@cont @#1-\the\@tempcnta @attrs\endcsname}}{}
259           %% internal counter for macro grabbing
260           \noexpand\csnumdef{cc#1Cnt}{\ccCurCount}%
261           \noexpand\ccUseProperty{#2}}%
262         \expandafter\expandafter\expandafter\def
263         \expandafter\expandafter\expandafter\cc@iterate@res
264         \expandafter\expandafter\expandafter{\expandafter\cc@iterate@res\@tempb}%
265       }%
266       \expandafter\def\expandafter\cc@iterate@res\expandafter{\cc@iterate@res\egroup}%
267       \cc@assign@res{\ccPrefix#3}%
268     }{}%
269 }

```

`\ccApplyCollection` is an alternative version of `\ccComposeCollection` and fully expands the result of the application of Property `{#2}` before it is stored inside the Component `{#3}`.

```

270 \def\ccApplyCollection#1#2#3{%
271   \ccIfComp{#3}{\cslet{cc@used@#3@override}\@empty}{
272     {\cc@apply@collection{#1}{#2}%

```

`\cc@comp@def` is used to pass a Counted Component into a TeX macro.

`{#1}` is a prefix to the def command, e.g., `\global` or `\protected`

`{#2}` is a CS token

`{#3}` is the Name of the Counted Component

`{#4}` is the Property that should be applied to all Members of the Counted Component

```

295 \def\cc@comp@def{\cc@opt@empty\cc@comp@def}
296 \def\cc@comp@def[#1]#2#3#4{%
297   \cc@apply@collection{#3}{#4}%
298   \ifx\cc@iterate@res\relax

300   \else
301     \def\@tempa{#1\def#2}%
302     \cc@assign@res{\@tempa}%
303   \fi
304 }

```

`\ccdefFromCountedComp` is the user-level command for *local* `\cc@comp@def`.

```

305 \def\ccdefFromCountedComp{\cc@comp@def}

```

`\ccgdefFromCountedComp` is the user-level command for *global* `\cc@comp@def`.

```

306 \def\ccgdefFromCountedComp{\cc@comp@def[\global]}
307 \def\ccpgdefFromCountedComp#1{\expandafter\ccgdefFromCountedComp\csname \ccPrefix #1\endcsname}

```

Declaring Counted Component

`\cc@counted@comp@scheme` gives the scheme how counted components are defined internally.

`{#1}` the name of the Counted Component.

```

308 \def\cc@counted@comp@scheme#1{\cc@cnt@grp-#1-\csname \cc@cnt@grp Cnt\endcsname}

```

`\ccDeclareCountedComponent` is a user-level macro to create a new Counted Component.

`{#1}` is the user-level name of the Component

```

309 \def\ccDeclareCountedComponent#1{%

```

```

310 \cc@def@counted@comp
311   {\cc@counted@comp@scheme{#1}}
312   {#1}
313   {}
314   {\expandafter\global}%
315 }

```

`\cc@def@counted@comp` is used to declare Counted Components.

`{#1}` is the internal name of the Component which is composed out of the group name, the value of the group counter and the user-level macro name `{#2}`

`{#2}` is the name of the Counted Component

`{#3}` is some custom code passed to the second argument of `\ccDeclareComponent`

`{#4}` is a modifier to the internal macro definition.

```

316 \def\cc@def@counted@comp#1#2#3#4{%
317   \ccDeclareComponent[#1]{#2}
318   {\bgroup#3\expandafter\global}
319   {\def\@tempa{\@cc@reset@components@\cc@cur@cont}}%
320   \edef\@tempb{\noexpand\csgundef{\cc@noexpand\cc@cur@cont @#1}}%

322   \egroup}%
323   #4\expandafter\long\expandafter\def\csname cc@\cc@cur@cont @#2\endcsname{\csname cc@
324     cc@cur@cont @#1\endcsname}%
325 }

```

Resetting Counted Component

`\cc@reset@components` is used to reset Counted Components to prevent later Containers of a given type to feed the components from the previous Container of the same type. Usually, this is prevented by keeping Component definitions strictly local.

In some cases, however, Components may be declared globally, i.e., they may be re-used after the Container is ended. In this so-called Asynchronous Processing of Components, the reset should be done at the very beginning of the next instance of the container type to prevent bleeding of one container's components into the next one, specifically if a container occurs more than once in the same document.

`{#1}` is the name of the Component Group

```

325 \def\cc@reset@components#1{%
326   \csname @cc@reset@components@#1\endcsname
327   \global\cslet{\cc@reset@components@#1}\relax%
328 }

```

Toggle Conditionals for Counted Components

`\ccToggleCountedConditionals` In order to process Counted Components, we need to re-define the Conditionals in a way such that the Component is expanded twice before the comparison takes place to correctly resolve the Component counter.

Warning! Use this macro only within local groups!

```

329 \long\def\ccToggleCountedConditionals{%
330   \let\cc@is@counted\relax

```

This re-definitions of `\ccIfComp` cannot use `etoolbox`'s `\cs...` macros since the conditional can be embedded inside itself. If an inner `csname` is undefined, the condition for the outer one would be reset before it can be expanded by `\ifx`.

```

331 \long\def\ccIfComp##1{%
332   \expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\ifx\
      csname cc@\cc@cur@cont @##1\endcsname\relax\expandafter\@secondoftwo\else\expandafter\

      \expandafter\@firstoftwo\else\expandafter\@secondoftwo\fi}%
342 \ccToggleCountedConditionalsHook% legacy
343 }

```

6 Hooks

TODO: Use latex3's hook facility instead. Look at latexreleases.sty to ensure forward compatibility

Hooks are used to patch code into different parts of a Container's processing chain.

`\ccDeclareHook` registers a new hook. Hooks always default to an empty string.

`[#1]` is the Container for which the Hook is declared. If omitted, this defaults to the currently active Container (`\cc@cur@cont`)

`{#2}` is the Hook's user-level name

```

344 \def\ccDeclareHook{\cc@opt@curcont\cc@declare@hook}
345 \def\cc@declare@hook[#1]#2{\expandafter\global\expandafter\let\csname cc@hook@#1@#2\endcsname\
      @empty}

```

`\ccAddToHook` adds new material to a Hook. If the hook has not yet been declared, a `\ccDeclareHook` for that hook is applied first. In that case, use the optional `[#1]` to specify the Container name that hook is intended for. If it is omitted, the current Container is used. `{#2}` is the name of the hook the material in `{#3}` is to be appended to.

```

346 \def\ccAddToHook{\cc@opt@curcont\cc@add@to@hook}
347 \def\cc@add@to@hook[#1]#2#3{%
348   \expandafter\ifx\csname cc@hook@#1@#2\endcsname\relax
349     \ccDeclareHook[#1]{#2}%
350   \fi
351   \csgappto{cc@hook@#1@#2}{#3}%
352 }

```

`\ccUseHook` expands the current state of the hook with the name `{#2}` from Container `[#1]` (current Container if omitted).

```

353 \def\ccUseHook{\cc@opt@curcont\cc@use@hook}
354 \def\cc@use@hook[#1]#2{\csuse{cc@hook@#1@#2}}

```

7 Properties

7.1 Setting Properties

`\ccSetProperty` is a user-level macro that provides the Property–Value interface for Containers.

`{#1}` is the name of the Property

`{#2}` is the Value assigned to that Property.

```
355 \long\def\ccSetProperty#1#2{\long\csdef{cc@\cc@cur@cont @#1}{#2}}
```

`\ccAppToProp` can be used add material to the *end* of an existing Property value.

`{#1}` is the name of the Property

`{#2}` is the material to be added to previous value of that Property

```
356 \def\ccAppToProp#1#2{%
357   \long\csappto{cc@\cc@cur@cont @#1}{#2}%
358 }
```

`\ccPreToProp` can be used add material to the *beginning* of an existing Property.

`{#1}` is the name of the Property

`{#2}` is the material to be inserted before the previous value of that Property

```
359 \def\ccPreToProp#1#2{%
360   \long\cspreto{cc@\cc@cur@cont @#1}{#2}%
361 }
```

`\ccPropertyLet` can be used to create an alias Property `{#1}` of a given Property `{#2}`. Is is equivalent to `\ccSetProperty{\#1}{\ccUseProperty{\#2}}`.

```
362 \long\def\ccPropertyLet#1#2{\long\csedef{cc@\cc@cur@cont @#1}{\expandonce{\csname cc@\cc@cur@cont @#2\endcsname}}}
```

`\ccPropertyLetX` creates a Property `{#1}` with the fully expanded value of another Property `{#2}`. Is is equivalent to `\ccSetPropertyX{\#1}{\ccUseProperty{\#2}}`.

```
363 \long\def\ccPropertyLetX#1#2{\long\csedef{cc@\cc@cur@cont @#1}{\csname cc@\cc@cur@cont @#2\endcsname}}}
```

`\ccSetPropertyVal` is a variant of `\ccSetProperty` that expands the value `{#2}` *once* before assigning it to the Property macro with the name `{#1}`. This can be used to assign the current value of a variable macro, dimension, counter or length to a Property.

```
364 \long\def\ccSetPropertyVal#1#2{\def\@tempa{\ccSetProperty{#1}}\expandafter\@tempa\expandafter{#2}}
```

`\ccSetPropertyX` is another variant of `\ccSetProperty`, but it *fully expands* the value (using `\edef`) defined in `{#2}` before the Property is stored in the Property macro named `{#1}`. Use this if you need to use conditionals to determine the actual values of Properties that otherwise expect fixed named or dimensional values.

```
365 \long\def\ccSetPropertyX#1#2{\long\csedef{cc@\cc@cur@cont @#1}{#2}}
```

`\ccAddToProperties` adds the material in `{#2}` to a Container of name `{#1}`'s *Properties* List.

```
366 \long\def\ccAddToProperties#1#2{\ccAddToType{Properties}{#1}{#2}}
```

7.2 Using Properties

`\ccUseProperty` is a user-level command to directly access a previously set Property with the name `{#1}`.

```
367 \def\ccUseProperty#1{\csuse{cc@\cc@cur@cont @#1}}
```

`\cc@store@prop` stores the result of the application of property `{#3}` in the control sequence `{#2}`. The optional `[#1]` can hold a definition modifier like `\global` or `\long`.

```
368 \def\cc@store@prop{\cc@opt@empty\cc@store@prop}%
369 \long\def\cc@store@prop[#1]#2#3{%
370   \protected@edef\@tempa{\ccUseProperty{#3}}%
371   #1\expandafter\def\expandafter#2\expandafter{\@tempa}%
372 }
```

`\ccdefFromProperty` expands an (implicit) Property `{#2}` and stores the result in (implicit) control sequence `{#1}`.

```
373 \def\ccdefFromProperty{\cc@store@prop}
```

`\ccgdefFromProperty` is the `\global` variant of `\ccdefFromProperty`.

```
374 \def\ccgdefFromProperty{\cc@store@prop[\global]}
375 \def\ccpgdefFromProperty#1{\expandafter\ccgdefFromProperty\csname \ccPrefix #1\endcsname}
```

`\ccUsePropertyEnv` is a user-level command to access a previously set Property and make it an environment accessible to Property specific processing instructions (see below).

```
376 \def\ccUsePropertyEnv#1{\cslet{cc@#1@active}{\relax}\csuse{cc@\cc@cur@cont @#1}\csundef{cc@#1
  @active}}
```

`\ccIfStrEqual` is a variant of etoolbox's `\ifstrequal` that first fully expands both arguments `{#1}` and `{#2}` (using `\edef`) before comparing them.

```
377 \def\ccIfStrEqual#1#2{%
378   \edef\@argi{#1}\edef\@argii{#2}%
379   \expandafter\expandafter\expandafter\ifstrequal
380     \expandafter\expandafter\expandafter{\expandafter\@argi\expandafter}%
381     \expandafter{\@argii}}
```

Local Property Overrides

`\cc@set@property@local` is a low-level macro to locally manipulate Properties.

`{#1}` is the CS token representing a method to alter the property (`\ccSetProperty`, `\ccAppToProp`, or `\ccPreToProp`)
`{#2}` is the name of the Property to be altered
`{#3}` is the new (or added) Value

```
382 \def\cc@set@property@locally#1#2#3{%
383   \let\cc@cur@cont\cc@cur@cont
384   \ifdefstring\cc@cur@cont{Heading}{\let\cc@cur@cont\ccCurSecName}{}%
385   \csappto{cc@type@Properties@\cc@cur@cont}{#1{#2}{#3}}%
386 }
```

The User level macros are Prefix sensitive. They exist in three flavours depending on whether the global Value of a Property should be kept or be replaced.

They all take two arguments:

`{#1}` is the name of the Property

`{#2}` is the value to be set, appended, or prepended to that Property, respectively.

`\ccSetPropLocal` sets a Property `{#1}` to a new value `{#2}`.

```
387 \def\ccSetPropLocal{\cc@set@property@locally\ccSetProperty}
388 \cslet{\ccPrefix SetPropLocal}\ccSetPropLocal%
```

`\ccAppPropLocal` appends the value `{#2}` to the *end* of an existing Property `{#1}`.

```
389 \def\ccAppPropLocal{\cc@set@property@locally\ccAppToProp}
390 \cslet{\ccPrefix AppPropLocal}\ccAppPropLocal%
```

`\ccPrePropLocal` appends the value `{#2}` to the *beginning* of an existing Property `{#1}`.

```
391 \def\ccPrePropLocal{\cc@set@property@locally\ccPreToProp}
392 \cslet{\ccPrefix PrePropLocal}\ccPrePropLocal%
```

7.3 Processing Instructions

In general, processing instructions are commands that are only visible to a specific process and ignored by others. In CoCoT_{EX}, Processing Instructions (PIs) are commands placed inside a Component that should only take effect when that Component is processed through a specific Property.

`\ccPI` is a Processing Instruction that executes `{#2}` when a Property with the name `{#1}` is currently processed with the `\ccUsePropertyEnv` macro.

```
393 \DeclareRobustCommand\ccPI[2]{\ifcsdef{cc@#1@active}{#2}{}}
```

7.4 Property Conditionals

`\ccIfProp` checks if a Property with the name `{#1}` is defined and non-empty. If so, do `{#2}`, otherwise do `{#3}`.

```
394 \long\def\ccIfProp#1#2#3{%
395   \expandafter\ifx\csname cc@cc@cur@cont @#1\endcsname\relax#3\else
396     \expandafter\ifx\csname cc@cc@cur@cont @#1\endcsname\cc@long@empty #3\else#2\fi
397   \fi
398   \ignorespaces}
```

`\ccIfPropVal` checks if a Property `{#1}` expands to `{#2}`. If so, do `{#3}`, otherwise do `{#4}`.

Warning: Do not use this conditional in Properties that are used in `\ccApplyCollection`!

```
399 \long\def\ccIfPropVal#1#2#3#4{\long\def\@tempa{#2}%
400   \expandafter\ifx\csname cc@cc@cur@cont @#1\endcsname\@tempa\relax#3\else#4\fi\ignorespaces}
```

8 Helper macros

8.1 Handling of Optional Arguments

Two simple internal macros to ease up the handling of optional arguments.

`\cc@opt@curcont` overrides stores the currently active Container name as future `#1`, unless the control sequence `{#1}` is called with an optional argument. In this case, the future `#1` is the value of that optional argument.

```
401 \long\def\cc@opt@curcont#1{\@ifnextchar[{#1}{#1[\cc@cur@cont]}}%
```

`\cc@opt@empty` passes an empty string as future `#1` if the optional argument is missing.

```
402 \long\def\cc@opt@empty#1{\@ifnextchar[{#1}{#1[]}}%
```

`\cc@opt@second` passes the first *mandatory* argument as value to the *optional* argument if the latter is missing.

```
403 \let\cc@opt@second\@dblarg
```

8.2 Iterators

`\cc@iterate` traverses in `[#1]`-th steps (defaults to +1) through counter `{#2}`, starting at number `{#3}` until and including number `{#4}` and does `{#5}` at every iteration (from `forloop.sty`, **Be aware** that incrementation of counter `{#2}` takes place after `{#5}` is called!):

```
404 \long\def\cc@iterate{\@ifnextchar[\cc@iterate]{\cc@iterate[\@one]}}%
405 \long\def\cc@iterate[#1]#2#3#4#5{%
406   #2=#3\relax%
407   \expandafter\ifnum#2>#4\relax%
408   \else
409   #5%
410   \advance#2 by #1\relax
411   \cc@iterate[#1]{#2}{\the#2}{#4}{#5}%
412 \fi}%

```

8.3 Attributes

Many macros and environments deal with optional arguments that are used to alter the behaviour of that macro or environment. The combination of a parameter and its set of possible values are called **Attributes**. In this section, we define the parsers for those parameters.

In order to catch the `babel` package's messing with the quote symbol, we make sure it has the correct cat-code.

```
413 \begingroup
414 \catcode`"=12
```

`\ccParseAttributes` High level wrapper for the attribute parser.

`{#1}` is the domain of the attribute

`{#2}` is the raw attribute list

```
415 \gdef\ccParseAttributes#1#2{%
416   \if!#1!\else
417   \if!#2!\else
418   \def\cc@cur@domain{#1}%
419   \cc@parse@attributes #2,,\@nil
420 \fi\fi}
```

The actual, recursively applying, parser comes in two parts:

`\cc@parse@attributes` parses the single attributes in an optional argument,

```
421 \gdef\cc@parse@attributes #1,#2,\@nil{%
422   \if!#1!\else
423     \cc@parse@kv#1==\@nil
424     \if!#2!\else
425       \cc@parse@attributes#2,\@nil
426     \fi\fi}
```

and

`\cc@parse@kv` distinguishes between the attribute name and its value(s).

```
427 \gdef\cc@parse@kv#1=#2=#3\@nil{%
428   \edef\@argii{#2}%
429   \ifx\@argii\@empty
430     \expandafter\let\csname cc@\cc@cur@domain @attr@#1\endcsname\@empty%
431   \else
432     \ifx #2 =\else
433       \expandafter\def\csname cc@\cc@cur@domain @attr@#1\endcsname{#2}%
434     \fi
435   \fi}
```

`\cc@parse@csv` takes a fallback macro `{#1}` and feeds it as argument to each item of the comma-separated list in the control sequence `{#2}`. The macro `{#1}` is stored internally as `\cc@parser@callback`.

```
436 \gdef\cc@parse@csv#1#2{%
437   \if!#1!\else
438     \let\cc@parser@callback#1%
439     \edef\cc@tempa{\csname #2\endcsname}%
440     \ifx\cc@tempa\@empty\else
441       \expandafter\cc@@parse@csv\cc@tempa,,\@nil
442     \fi
443   \fi}
```

`\cc@@parse@csv` applies `\cc@parser@callback` to the first item of a comma-separated pair and feeds the second item to itself.

```
444 \gdef\cc@@parse@csv #1,#2,\@nil{%
445   \if!#1!\else
446     \cc@parser@callback{#1}%
447   \fi
448   \if!#2!\else
449     \cc@@parse@csv#2,\@nil
450   \fi
451 }
452 \endgroup
```

`\ccEvalAttributes` is a special Type Evaluator for Containers that define their Instance's attributes as Data Type. The Type then contains a list of `\ccDeclareAttributeHandler` statements for each of the allowed attributes.

`[#1]` is the Attribute Domain (defaults to the current Container name)

`{#2}` is the Container Instance's raw Attribute list.

```
453 \def\ccEvalAttributes{\cc@opt@curcont\cc@eval@attributes}%
454 \def\cc@eval@attributes[#1]#2{%
```

First we check if the Container Instance has a dedicated Attribute Type defined

```
455 \expandafter\ifx\csname cc@type@#1@Attributes\endcsname\relax
```

If so, we parse the Attribute list.

```
456 \ccParseAttributes{#1}{#2}%
```

After reading the Attribute list, we prepare unpacking the Attribute Data Type. Usually, the Type contains of a list of `\ccDeclareAttributeHandler` statements, but it can also handle the Attributes directly. The Attribute handler macro is defined locally:

`\ccDeclareAttributeHandler*` declares an Attribute handler. The *starred* version is for Attributes that are not expected to hold a value (i. e., switches), while the *non-starred* version is for Attributes that hold a value (key-value pairs). The value(s) for each matching Attribute is stored in `\ccAttrVal`. You may want to copy that value into another macro inside the third argument of the Handler macro for later evaluation, as it will be redefined by an Attribute Handler that is further down the Handler list.

`{#1}` is the name of the attribute (i. e., the part before the '=')

`{#2}` is code that is called when the Attribute does not occur in the Attribute list `{#1}`

`{#3}` is code that is called when the Attribute does occur in the Attribute list `{#1}`.

```
457 \def\ccDeclareAttributeHandler{%
458   \let\cc@is@starred\undefined
459   \ifstar
460     {\let\cc@is@starred\relax\cc@declare@attribute@handler}
461     {\cc@declare@attribute@handler}%
462   \def\cc@declare@attribute@handler##1{\cc@opt@empty{\cc@declare@attribute@handler{##1}}}
463   \def\cc@declare@attribute@handler##1[##2]##3{%
464     \let\ccAttrVal\relax
465     \ifx\cc@is@starred\relax
466       \ccIfAttrIsSet{#1}{##1}{##3}{##2}%
467     \else
468       \ccIfAttr{#1}{##1}
469       {\letcs\ccAttrVal{cc@#1@attr@##1}##3}
470       {##2}%
471     \fi
472   }%
```

With the Handler macro in place, we evaluate the Attributes data Type, thus parsing the Attributes.

```
473 \ccEvalType{Attributes}%
474 \else
```

If the Container has no Attributes type defined, we check if the Container instance has, in fact, Attributes

```
475 \if!#2!\else
```

If so, we issue a warning since we cannot know how to deal with the Attributes.

```
476 \ccPackageWarning{Kernel}{Attribute}
477 {Container instance on line \inputlineno\space has Attributes,^^Jbut Container `#1'
   provides no Attribute handlers!}
478 \fi
479 \fi
480 }
```

`\ccGetAttribute` returns the value of an attribute.

`{#1}` is the attribute domain

`{#2}` is the attribute name

```
481 \def\ccGetAttribute#1#2{\csuse{cc@#1@attr@#2}}
```

`\ccIfAttr` can be used to call macros depending on whether an attribute is set, or not.

`{#1}` is the attribute domain
`{#2}` is the attribute name
`{#3}` is the then case
`{#4}` is the else case

```
482 \def\ccIfAttr#1#2#3#4{\ifcsdef{cc@#1@attr@#2}{#3}{#4}}
```

`\ccWhenAttr` is a variant of `\ccIfAttr` that omits the *else* branch.

`{#1}` is the attribute domain
`{#2}` is the attribute name
`{#3}` is the then case

```
483 \def\ccWhenAttr#1#2#3{\ifcsdef{cc@#1@attr@#2}{#3}{}}
```

`\ccUnlessAttr` is a variant of `\ccIfAttr` that omits the *then* branch.

`{#1}` is the attribute domain
`{#2}` is the attribute name
`{#3}` is the else case

```
484 \def\ccUnlessAttr#1#2#3{\ifcsdef{cc@#1@attr@#2}{}{#3}}
```

`\ccIfAttrIsStr` can be used to call macros depending if an attribute is set to the current (sub)container or group and what value it has.

`{#1}` is the attribute domain
`{#2}` is the attribute name
`{#3}` is the comparing value
`{#4}` is the then case
`{#5}` is the else case

```
485 \def\ccIfAttrIsStr#1#2#3#4#5{\ccIfAttr{#1}{#2}{\ifcsstring{cc@#1@attr@#2}{#3}{#4}{#5}}{#5}}
```

`\ccIfAttrIsSet` can be used to check if a value-less attribute has been set (i.e., it expands to `\@empty`).

`{#1}` is the attribute domain
`{#2}` is the attribute name
`{#3}` is the then case
`{#4}` is the else case

```
486 \def\ccIfAttrIsSet#1#2#3#4{\ccIfAttr{#1}{#2}{\expandafter\ifx\csname cc@#1@attr@#2\endcsname\@empty#3\else#4\fi}{#4}}
```

8.4 Style Classes

Style Classes are locally usable sub-Containers.

`\ccDeclareClass` The top-level macro `\ccDeclareClass[#1]{#2}[#3]{#4}` has four arguments, two of which are optional. `{#2}` is the name of the class. If this argument is empty, the special class name `default` is used. `{#4}`

is the declaration block of the class. This argument usually contains a set of Property assignments using the `\ccSetProperty{<prop>}{<val>}` macro, see Sect. 7. The first optional argument `[#1]` is the Style Class' parent Container. Using parent Containers, you can have Style Classes of the same name for different (sub-)Containers, e.g., a `default` class for each float and heading Container. The second optional argument `[#3]` is the parent Style Class. Properties from that Style Class are loaded automatically prior to the loading of the current Style Class's Properties. This applies recursively allowing for a cascading of property values, as in CSS.

```

487 \long\def\ccDeclareClass{\@ifnextchar [{\@cc@set@class}{\@cc@set@class[default]}}{%]
488 \long\def\@cc@set@class[#1]#2{\cc@opt@empty{\cc@set@class[#1]{#2}}}%
489 \long\gdef\cc@default@class@default{}
490 \long\def\cc@set@class[#1]#2[#3]#4{%
491   \def\@argii{#2}\ifx\@argii\empty\let\@argii\cc@str@default\fi%
492   \if!#3!\else
493     \expandafter\long\expandafter\def\csname cc@#1@class@\@argii @parent\endcsname{#3}%
494   \fi
495   \expandafter\long\expandafter\def\csname cc@#1@class@\@argii\endcsname{#4}%
496 }

```

`\ccUseStyleClass` is a user-level macro to expand and “activate” a Style Class' Properties, those of its recursive ancestor Style Classes, and the default Style Class respecting the current Container.

`{#1}` is the Style Class name

`{#2}` is the Container name

```

497 \def\ccUseStyleClass#1#2{%
498   \expandafter\ifx\csname cc@#2@class@#1\endcsname\relax
499     \expandafter\ifx\csname cc@default@class@#1\endcsname\relax
500       \PackageError{cocotex.cls}{Class `#1' with scope `#2' not defined!}{Please declare the
501         class `#1'!}%
502     \fi
503   \csname cc@default@class@#1\endcsname%
504   \expandafter\ifx\csname cc@#2@class@#1@parent\endcsname\relax\else
505     \expandafter\ccUseStyleClass\expandafter{\csname cc@#2@class@#1@parent\endcsname}{#2}%
506   \fi
507   \csname cc@#2@class@#1\endcsname}

```

8.5 The CoCoTeX Logo

`\CoCoTeX` the CoCoTeX Logo.

```

508 \DeclareRobustCommand\CoCoTeX{\texorpdfstring{{C\kern-.1em o\kern-.033emC\kern-.1em o}\kern-.133
    em\TeX}{CoCoTeX}}

```

</kernel>

Module 3

coco-common.dtx

```
<*common>
```

This file provides some macros that are used in more than one CoCoTeX module.

```
23 %%
24 %% module for CoCoTeX that provides some commonly used base macros.
25 %%
26 %% Maintainer: p.schulz@le-tex.de
27 %%
28 %% lualatex - texlive > 2019
29 %%
30 \NeedsTeXFormat{LaTeX2e}[2018/12/01]
31 \ProvidesPackage{coco-common}
32 [2024/03/23 0.4.1 CoCoTeX common module]
```

Load key/value option parser packages in case coco-common is used without the cls.

```
33 \RequirePackage{kvoptions-patch}
34 \RequirePackage{xkeyval}
35 \RequirePackage{iftex}
```

1 Package options

1.1 Accessibility Features

Default color encoding passed as option to the `xcolor` package.

```
36 \def\cc@color@enc{cmyk}
37 \define@choicekey{coco-common.sty}{color-enc}[\@cc@color@enc\nr]{srgb,rgb,gray,cmy,cmyk,natural}
38   {cmyk}{%
39     \let\cc@color@enc\cc@color@enc
40     \ifcase\nr\relax% srgb
41       \def\cc@color@enc{rgb}%
42     \or% rgb
43     \or% gray
44     \or% cmy
45     \def\cc@color@enc{cmyk}%
46     \or% cmyk
47     \else% natural, i.e. no conversion of color spaces takes place
48     \fi
49   }
50 \ProcessOptionsX
51 \PassOptionsToPackage{\cc@color@enc}{xcolor}%
```

`\ccIfPreamble` is true as long as there has not been a `\begin{document}`.

```
51 \def\cc@if@preamble{\ifx\nodocument\relax\expandafter\@secondoftwo\else\expandafter\@firstoftwo
    \fi}
52 \let\ccIfPreamble\cc@if@preamble
```

2 Commonly Used Low-Level Macros and Registers

If CoCoTeX is used in conjunction with `xerif`¹, we include the `coco-xerif` module, which, albeit not an official part of the CoCoTeX framework, is essential for the Framework to work with `xerif` generated `.tex` files.

```
53 \IfFileExists{coco-xerif.sty}{\RequirePackage{coco-xerif}}{}
```

The `coco-kernel` module contains the core functions of the CoCoTeX framework.

```
54 \RequirePackage{coco-kernel}
```

2.1 Hard Dependencies

Hard requirements for all CoCoTeX modules:

```
55 \RequirePackage{xcolor}
```

Including the `graphicx` package and catching case-insensitive graphics file's endings from Word:

```
56 \RequirePackage{graphicx}
57 \DeclareGraphicsRule{.EPS}{eps}{.EPS}{}
```

2.2 Common Variables

String Variables for Value Comparisons

`\cc@str@default` is a CS token that holds the string “default” for comparisons.

```
58 \def\cc@str@default{default}
```

`\cc@str@table` is a CS token that holds the string “table” for comparisons.

```
59 \def\cc@str@table{table}
```

`\cc@str@figure` is a CS token that holds the string “figure” for comparisons.

```
60 \def\cc@str@figure{figure}
```

`\cc@str@top` is a CS token that holds the string “top” for comparisons.

```
61 \def\cc@str@top{top}
```

¹See <https://github.com/transpect/xerif/>

`\cc@str@bottom` is a CS token that holds the string “bottom” for comparisons.

```
62 \def\cc@str@bottom{bottom}
```

Box Registers

Some temporary boxes that won’t interfere with LaTeX’s temporary boxes.

`\cc@tempboxa` is a temporary box register used throughout CoCoTeX.

```
63 \newbox\cc@tempboxa
```

`\cc@tempboxb` is another temporary box register used throughout CoCoTeX.

```
64 \newbox\cc@tempboxb
```

Temporary Length and Skip Registers

`\cc@tempskipa` is a temporary skip register used throughout CoCoTeX.

```
65 \newskip\cc@tempskipa
```

2.3 Helper macros

`\cc@topstrut` is a `\strut` that has the height of `\topskip` and the depth of the difference between the `\baselineskip` and `\topskip`.

```
66 \def\cc@topstrut{\vrule\@width\z@\@height\topskip\@depth\dimexpr\baselineskip-\topskip\relax}
```

`\cc@afterbox` prevents indentation and additional spacing after environments. Intended to be used in combination with `\aftergroup`.

```
67 \def\cc@afterbox{%
68   \everypar{%
69     \if@nobreak
70       \clubpenalty \clubpenalty
71       \if@afterindent \else
72         {\setbox\z@\lastbox}%
73         \everypar{}%
74       \fi
75     \else
76       \clubpenalty \clubpenalty
77       {\setbox\z@\lastbox}%
78       \everypar{}%
79     \fi}}
80
```

2.4 Masks

These macros are intended to mask non-content markup, like page- or line breaking commands in order to find and remove or alter them easier.

`\hack` intended to mask line breaking macros.

```
81 \let\hack\@firstofone
```

`\hackfor` intended to hide line breaking macros.

```
82 \let\hackfor\@gobble
```

`\Hack` intended to mask page breaking macros.

```
83 \let\Hack\@firstofone
```

`\Hackfor` intended to hide page breaking macros.

```
84 \let\Hackfor\@gobble
```

`\@gobbleopt` intended to nullify a macro's argument with a possible optional argument interfering.

Use it like this: `\let\yourMacroWithOptArg\@gobbleopt`

```
85 \long\def\@gobbleopt{\@ifnextchar[\@gobbleopt{\@gobbleopt[]}}%
86 \long\def\@gobbleopt[#1]#2{%
```

`\ccGobble` is used to de-activate certain macros to prevent them from being called multiple times while processing contents. An example is a footnote inside a caption while calculating the height of the caption. In this case, we need the space the footnote symbol requires without the actual footnote being written into the footnote insert, since that should happen when we actually print the caption.

```
87 \def\ccGobble{%
88   \renewcommand\footnote[2][\the\c@footnote]{\def\@thefnmark{##1}\@makefnmark}%
89   \renewcommand\index[2][]{}%
90   \renewcommand\marginpar[2][]{}%
91   \renewcommand\glossary[2][]{}%
92   \let\hypertarget\@gobbletwo
93   \let\label\@gobble
94 }%
```

2.5 Arithmetics

`\CalcRatio` is used to calculate the ratio between two integers `{#1}` and `{#2}`.

```
95 \def\CalcRatio#1#2{\strip@pt\dimexpr\number\numexpr\number\dimexpr#1\relax*65536/\number\dimexpr
   #2\relax\relax sp}
```

`\CalcModulo` is used to calculate the remainder of integer division of `{#1}` by `{#2}`. This needs a different approach than the common modulo definition, which would return negative results in some cases, as TeX rounds up the quotient of `{#1}` and `{#2}` if the first decimal place is equal to or greater 5.

```
96 \def\CalcModulo#1#2{\number\numexpr#1+#2-((#1+#2/2)/#2)*#2\relax}
```

`\minusvspace` Counterpart to L^AT_EX's `\addvspace`: if the value of `\minusvspace` is larger than `\lastskip`, `\lastskip` is used. Otherwise, the value of `\minusvspace` is used.

```

97 \def\@xminusvskip{%
98   \ifdim\lastskip<\@tempskipb
99   \else
100    \ifdim\lastskip<\z@
101    \else
102    \ifdim\@tempskipb<\z@
103    \advance\@tempskipb\lastskip
104    \fi
105    \vskip-\lastskip
106    \vskip \@tempskipb
107    \fi
108   \fi}
109 \def\minusvspace#1{%
110   \ifvmode
111   \if@minipage\else
112   \ifdim \lastskip =\z@

```

Compatibility to texlive pre 2020:

```

113   \ifx\@vspace@calcify\@undefined
114   \vskip #1\relax
115   \else
116   \@vspace@calcify{#1}%
117   \fi
118   \else
119   \setlength\@tempskipb{#1}%
120   \@xminusvskip
121   \fi
122   \fi
123 \else
124   \@noitemerr
125 \fi}

```

2.6 Determine actual page number

We need to determine the real page a floating object is printed. This mechanism is largely an adaption of the mechanism used in the `marginnote` package.

Counting absolute page numbers, however, may be misleading when the `coco-title` module is loaded and the cover page is not followed by an empty page. Therefore, we save the default page counter from L^AT_EX to evaluate it independently from the actual manner of counting.

`\the@cc@thispage` temporarily stores the current page number.

```

126 \def\the@cc@thispage{%

```

`\cc@abspage` is a counter for the absolute page number.

```

127 \newcount\cc@abspage \cc@abspage\z@

```

`\thecc@abspage` is the output formatter for the `\cc@abspage` counter.

```

128 \def\thecc@abspage{\the\cc@abspage}

```

`\ifcc@odd` is a conditional that is set to true if the current absolute page number is not divisible by 2.

```
129 \newif\if@cc@odd \@cc@oddtrue
```

The absolute page counter is injected directly into L^AT_EX's output routine:

```
130 \AtBeginDocument{%
131   \global\cc@abspage=\c@page\relax%
132   \g@addto@macro\@outputpage{\global\cc@abspage\c@page}%
133 }
```

We split the testing mechanism into two parts.

`\ccTestPage` is run before the floating object is placed. It will store the page according to the placement in the tex source code.

```
134 \def\ccTestPage{%
135   \expandafter\ifx\csname the@cc@thispage\endcsname\@empty
136   \gdef\the@cc@atthispage{1}%
137   \else
138   \expandafter\ifnum \the@cc@thispage=\cc@abspage%
139   \begingroup
140     \@tempcnta\the@cc@atthispage\relax
141     \advance\@tempcnta\@ne\relax
142     \xdef\the@cc@atthispage{\the\@tempcnta}%
143   \endgroup
144   \else
145   \gdef\the@cc@atthispage{1}%
146   \fi
147 \fi
148 \xdef\the@cc@thispage{\the\cc@abspage}%
149 \let\@cc@curpage\relax
150 \expandafter\ifx\csname \cc@cur@cont-\the@cc@thispage-\the@cc@atthispage\endcsname\relax
151   \ifodd\cc@abspage\relax\@cc@oddtrue\else\@cc@oddfalse\fi
152 \else
153   \edef\@cc@curpage{\expandafter\expandafter\expandafter\@firstofone\csname \cc@cur@cont-\
154     the@cc@thispage-\the@cc@atthispage\endcsname}%
155   \ifodd\@cc@curpage\relax\@cc@oddtrue\else\@cc@oddfalse\fi
156 \fi
157 }
```

`\ccSavePage` is the second macro, which writes the actual page number into the aux files.

```
157 \def\ccSavePage{%
158   \protected@write\@auxout{\def\the@cc@cur@cont{\cc@cur@cont}\let\thecc@abspage\relax}{%
159     \string\expandafter\string\gdef\string\csname\space \cc@cur@cont-\the@cc@thispage-\
160       the@cc@atthispage\string\endcsname{\thecc@abspage}}%
161 }
```

3 Re-Thinking L^AT_EX Core Functions

3.1 Keeping .aux-Files Up-to-Date

`\ccBreak` is a general line break macro intended to be re-defined if necessary without touching L^AT_EX's kernel page and line breaking macros.

```
161 \DeclareRobustCommand*\ccBreak{\hfill\break}
```

```
162 \cslet{\ccPrefix break}\ccBreak
```

3.2 Content lists

Default L^AT_EX Content Lists

This part contains macros to ‘simplify’ the generation of content lists like the Table of Contents or List of Figures/Tables, etc.

Entries in the list-files (e.g., `\jobname.toc`, `\jobname.lof`, etc.) usually contain `\contentsline` macros that expand to `l@<level>`. Whenever a level of Components that are to be written into content lists is declared, the package automatically generates a `\cc@l@<level>` macro for this level of entries. The content-baring argument of `\ccContentsline` (or `\cc@l@<level>`, resp.) contains Components.

Once a list file is read, those `\cc@l@<level>` macros are expanded in two steps. Each entry constitutes a Container in its own right. It therefore can have multiple Components. The first step is the extraction phase, where the entry’s Container is dynamically declared, the corresponding properties are initialised, and its Components are extracted

`\cc@init@l@` is a low-level macro used to dynamically define `\cc@l@<level>` macros.

`[#1]` is an override for counters that have to be restored
`{#2}` is the list file ending (raw entries being stored in a file `\jobname.{#2}`)
`{#3}` is a number that indicated the nesting depth
`{#4}` is the nested level’s unique name.

```
163 \def\cc@init@l@{\cc@opt@empty\cc@init@l@}%
164 \def\cc@init@l@[#1]#2#3#4{%
165   \expandafter\ifx\csname c@#2depth\endcsname\relax
166     \expandafter\global\expandafter\newcount\csname c@#2depth\endcsname
167     \expandafter\global\csname c@#2depth\endcsname=0\relax
168   \fi
169   \expandafter\ifx\csname cc@#2@extract@data\endcsname\relax
170     \expandafter\let\csname cc@#2@extract@data\endcsname\cc@extract@generic
171   \fi
172   \expandafter\ifx\csname cc@#2@print@entry\endcsname\relax
173     \expandafter\let\csname cc@#2@print@entry\endcsname\cc@print@generic
174   \fi
175   \expandafter\long\expandafter\gdef\csname cc@l@#4\endcsname##1##2{%
176     \ifLuaTeX\suppresslongerror=1\fi
177     \expandafter\ifnum \csname c@#2depth\endcsname<#3\relax
178     \else
179       \bgroup
```

`\ccTocLink` is used to link list entries to their destination.

```
180 \long\def\ccTocLink####1{\hyper@linkstart{link}{\@contentsline@destination}{####1}\hyper@linkend}%
```

```
181 \csname cc@#2@extract@data\endcsname{#3}{#4}{##1}{##2}%
182 \csname cc@#2@print@entry\endcsname{#4}%
183 \egroup
184 \fi
185 \ifLuaTeX\suppresslongerror=0\fi
186 }}
```

`\ccContentsline` is our version of L^AT_EX’s `\contentsline`.

`{#1}` is the name of the list counter

{#2} is the name of the list entry
 {#3} is the page number
 {#4} is the hyperref destination

```
187 \long\def\ccContentsline#1#2#3#4{\gdef\@contentsline@destination{#4}%
188   \csname cc@l@#1\endcsname{#2}{#3}}
```

`\cc@extract@generic` is a fallback extractor for a list entry. It is used when the list handler does not provide a case-specific extractor for the entries.

{#1} is the name of the list counter
 {#2} is the name of the list entry
 {#3} is the page number
 {#4} is the hyperref destination

```
189 \def\cc@extract@generic#1#2#3#4{}
```

`\cc@print@generic` is the fallback output generator for the composed list entry {#1}.

```
190 \def\cc@print@generic#1{}
```

`\cc@expand@l@contents` expands the content of the `cc@l@<level>` macro and contains some code to catch and handle standard L^AT_EX headings.

{#1} is the content of the `cc@l@`-Macro
 {#2} is the name of the handling Container
 {#3} is the Component prefix
 {#4} is the name of the Content component

```
191 \def\cc@expand@l@contents#1#2#3#4{%
192   \global\let\cc@tempa\relax
193   \sbox\z@{\def\numberline##1{\xdef\cc@tempa{\noexpand\csdef{cc@#2@#3Number}{##1}}}{#1}}%
194   \ifdim\wd\z@>\z@
195     \let\numberline\@gobble%
196     \protected@csdef{cc@#2@#3#4}{#1}%
197     \cc@tempa
198   \else
199     #1%
200   \fi
201   \global\let\cc@tempa\relax
202 }
```

Custom Content Lists

`\ccDeclareContentList` provides an interface for additional content lists.

{#1} is the name of the custom content
 {#2} is a comma separated list of container names the instances of which should be listed in the custom contents list

```
203 \def\ccDeclareContentList#1#2{%
204   \def\cc@add@extra@c1##1{%
205     \expandafter\ifx\csname cc@##1@extra@c1\endcsname\relax
206     \csgdef{cc@##1@extra@c1}{#1}%
207   \else
208     \csgappto{cc@##1@extra@c1}{, #1}%
209   \fi}%
210   \edef\@argii{#2}%
211   \cc@parse@csv\cc@add@extra@c1{\@argii}%
```

```

212 \expandafter\newwrite\csname cc@cl@#1\endcsname\relax
213 }

```

`\ccCreateContentListEntries` creates entries for Custom Content Lists. It is called during the processing of a container's instance.

`{#1}` is the name of the calling Container
`{#2}` is the name of the file stream
`{#3}` is the level of the entry
`{#4}` is the current page counter
`{#5}` is the current hyperref label

```

214 \def\ccCreateContentListEntries#1#2#3#4#5{%
215   \def\cc@add@extra@cl##1{%
216     \expandafter\protected@write\csname cc@cl@##1\endcsname
217       {\ccGobble}%
218     {\protect\ccContentsline{#2}{#3}{#4}{#5}\protected@file@percent}\relax
219   }%
220   \ifcsdef{cc@#1@extra@cl}{%
221     \cc@parse@csv\cc@add@extra@cl{cc@#1@extra@cl}}{%
222   }

```

3.3 Indentation and Left Margins of Potentially Numbered Items

The **left margin** means the space between the left border of the page area and the imaginary line that multi-line text aligns to. The **indent** is the offset of the very first line of that block of text relative to that value.

If the **indent** is a negative value you'll get a hanging indent; if it is positive, you get a paragraph style indent, and if it is set to **Opt**, you get a clean alignment of the whole item.

CoCoTeX provides a feature that allows the indentation of counted elements to be just as wide as the widest Number of the same level (if **indent** is set to **auto**), as well as a feature that allows the indent to be as wide as all Numbers of the same container type (if **indent** is set to **auto-global**).

The approach to set the **indent**, **margin-left** and the position of the Number Component in numbered items such as Headings, entries in ToC and listof-X, captions, etc. is to store the maximum width for each level and the maximum width across all Numbers of a Container Type in the .aux file at the very end of the compilation after it has been constantly updated during the entire L^AT_EX runtime. That way, for the next L^AT_EX run, the maximum values are available immediately and can be used to fortify those parameters.

`\cc@store@latest` is a low-level macro that stores the maximum value of a dimension Property `{#1}`. An internal Property `\#1-local` is constantly updated whenever the macro is called and the previously stored value is lower than the one given in `{#2}`.

The first call of the macro for a given Property triggers an addendum to the `\@enddocumenthook` which causes the last value for that dimension to be stored in the .aux file. If the Property hasn't been set from a previous L^AT_EX run or a previous call to the `\cc@store@latest` macro for the same Property and the same level, it is set to `{#2}`.

`{#1}` is the internal name of the property
`{#2}` is the check value.

```

223 \def\cc@store@latest#1#2{%
224   \expandafter\ifx\csname cc-\cc@cur@cont-#1\endcsname\relax
225     \csxdef{cc-\cc@cur@cont-#1}{#2}%
226   \else
227     \expandafter\ifdim\csname cc-\cc@cur@cont-#1\endcsname<#2\relax
228       \csxdef{cc-\cc@cur@cont-#1}{#2}%
229     \fi
230   \fi

```

```

231 \expandafter\ifx\csname cc-\cc@cur@cont-#1-local\endcsname\relax
232 \csxdef{cc-\cc@cur@cont-#1-local}{#2}%
233 \else
234 \expandafter\ifdim\csname cc-\cc@cur@cont-#1-local\endcsname<#2\relax
235 \csxdef{cc-\cc@cur@cont-#1-local}{#2}%
236 \fi
237 \fi

```

The second step is to store the highest values in the .aux file for later LaTeX runs. A `\write\@auxout` command for the storage macro is therefore added to the `\@enddocumenthook` and a flag is set that indicates that the write command has already been added to the hook, since that needs to be done only once for each to-be-stored dimension.

Note that the value that is eventually stored, is the updated *local* maximum, not the value that is retrieved at the beginning of the run. This allows the values to be down-graded if the LaTeX source changed during two consecutive runs. However, if values change, you still need to do at least two more \LaTeX runs before the values stabilize.

```

238 \ifcsdef{cc-\cc@cur@cont-#1-stored-trigger}{%
239   {\edef\@tempa{%
240     \noexpand\immediate\noexpand\write\noexpand\@auxout{%
241       \noexpand\string\noexpand\csgdef{cc-\cc@cur@cont-#1}{%
242         \noexpand\csname cc-\cc@cur@cont-#1-local\noexpand\endcsname}}}%
243     \expandafter\AtEndDocument\expandafter{\@tempa}%
244     \csgdef{cc-\cc@cur@cont-#1-stored-trigger}{\@empty}}}%

```

`\cc@format@number` calculates number widths and prepares macros to be used by the user.

`{#1}` is the internal Property prefix
`{#2}` is the user-level Component prefix
`{#3}` is the numerical list level.

```

245 \def\cc@format@number#1#2#3{%
246   \ccSetPropertyVal{#1curr-number-level}{#3}%

```

First step: measuring the natural width of the Number if it exists for the current item.

```

247 \ccIfComp{#2Number}
248   {\sbox\z@{\ccUseProperty{#1number-format}}}
249   {\sbox\z@{}}%

```

Second step: we store the width of `\box0` if it is wider than the previously stored width for that level. The end value will be written into the .aux file during expansion of the `\@enddocumenthook`. We do the same for the maximum across *all* levels of the same Container Type.

```

250 \cc@store@latest{#1number-#3-maxwd}{\the\wd\z@}%
251 \cc@store@latest{#1number-maxwd}{\the\wd\z@}%

```

We provide the maximum level as a user-level Property `#1number-width-level-max`, the global maximum across all levels as `#1number-width-max`, and the width of the current number as `#1number-width`.

```

252 \ccSetPropertyVal{#1number-width-level-max}{\csname cc-\cc@cur@cont-#1number-#3-maxwd\
    endcsname}%
253 \ccSetPropertyVal{#1number-width-max}{\csname cc-\cc@cur@cont-#1number-maxwd\endcsname}%
254 \ccSetPropertyVal{#1number-width}{\the\wd\z@}%

```

Third step: we calculate and fortify the actual `#1margin-left` (i.e., the overall left indent of the whole item) and `#1indent` (offset of the first line) of the entry.

```

255 \cc@get@indent{#1}{#3}%
256 \cc@set@hang{#1}%
257 }

```

`\cc@set@hang` determines and sets the hanging indent of a counter.

`{#1}` is the internal Property prefix

```
258 \def\cc@set@hang#1{%
```

First, we set the `#1hang-number` to be an alias of `#1number-format` as fallback.

```
259 \ccPropertyLet{#1hang-number}{#1number-format}%
```

Then, we check for `#1indent`.

```
260 \ccIfProp{#1indent}  
261 {\ifdim\ccUseProperty{#1indent}<\z@
```

If it is set and negative, we alter the `#1hang-number` Property in such a way that it is shifted to the left by `#1indent` amount and put into a hbox of `-#1indent` width (remember that the value is negative).

```
262 \ccSetProperty{#1hang-number}{%  
263 \hskip\ccUseProperty{#1indent}%  
264 \hbox to -\ccUseProperty{#1indent}{%  
265 \ccIfPropVal{#1number-align}{left}{\hss}%  
266 \ccUseProperty{#1number-format}%  
267 \ccIfPropVal{#1number-align}{right}{\hss}}}%  
268 \fi}{}}
```

In all other cases, we stick to the default (`#1number-format`) we set in the first step.

`\cc@calc@margin@left` determines the left margin of the current level by subtracting the current level's indent from the left margin of the next-higher level. “Next-higher” meaning “hierarchically”, i.e., the level counter is *lower*. Remember that for hang indent, the indent is negative, so `margin-left` grows larger.

`{#1}` is the Property prefix

`{#2}` is the current numerical list level.

```
269 \def\cc@calc@margin@left#1#2{%  
270 \@tempcnta\numexpr#2-\@ne\relax  
271 \expandafter\ifx\csname cc-\cc@cur@cont-#1\the\@tempcnta-margin-left\endcsname\relax  
272 \@tempdima=-\ccUseProperty{#1indent}\relax%  
273 \else  
274 \@tempdima=\dimexpr\csname cc-\cc@cur@cont-#1\the\@tempcnta-margin-left\endcsname-\  
ccUseProperty{#1indent}\relax  
275 \fi  
276 \cc@store@latest{#1#2-margin-left}{\the\@tempdima}%  
277 \ccSetProperty{#1margin-left}{\the\@tempdima}}
```

`\cc@get@indent` Eventually, write the actually used values for `margin-left` and `indent` into the current container's Property list.

`{#1}` is the CS token of a method that is called to calculate the actual left margin of the list item. It defaults to above's

`\cc@calc@margin@left` and is fed the two mandatory arguments of the `\cc@get@indent` macro, namely

`{#2}` for the internal property prefix, and

`{#3}` for the numerical list level.

The callback method should set and store the `#2margin-left` Property.

```
278 \def\cc@get@indent{\@ifnextchar[{\cc@get@indent}{\cc@get@indent[\cc@calc@margin@left]}}  
279 \def\cc@get@indent[#1]#2#3{%
```

First, we need to store the initial values for both `#2margin-left` and `#2indent` since, first their values might be non-dimensional, and second, they will be altered during macro expansion to ultimately being passed to `\hskip`.

```

280 \ccPropertyLetX{int-#2margin-left}{#2margin-left}%
281 \ccPropertyLetX{int-#2indent}{#2indent}%
282 \ccIfPropVal{#2indent}{auto-global}

```

If `#2indent` is set to `auto-global`, the item gets an `indent` that is set to the negative value of the maximum width of all numbers across all Levels of the same Container Type. The same maximum is added to the user-set value of `margin-left`.

```

283 {\ccSetPropertyX{#2indent}{-\ccUseProperty{#2number-width-max}}}%

```

If the user has set `#2margin-left` to `auto`, we reset it to empty.

```

284 \ccIfPropVal{#2margin-left}{auto}{\ccSetProperty{#2margin-left}{}}{}%

```

If the user has not set `margin-left`, we set it to `\z@`.

```

285 \ccIfPropVal{#2margin-left}{
286   {\ccSetProperty{int-#2margin-left}{\z@}}
287   {\ccPropertyLetX{int-#2margin-left}{#2margin-left}}%
288   \ccSetPropertyX{#2margin-left}{\dimexpr\ccUseProperty{#2number-width-max}+\ccUseProperty{int
    -#2margin-left}\relax}}

```

Next, we check if `#2margin-left` is set to `auto`.

```

289 {\ccIfPropVal{int-#2margin-left}{auto}

```

If `#2margin-left` is set to `auto`, all items of the same level get the same left margin that is determined by the sums of the indents of all higher levels.

```

290 {\ccIfPropVal{int-#2indent}{auto}

```

if `#2indent` is also set to `auto`, the `indent` of the current item is set to the widest Number of the same level.

```

291 {\ccSetPropertyX{#2indent}{-\ccUseProperty{#2number-width-level-max}}}

```

otherwise it is set to the value of `indent`, or `Opt` if it was not set at all.

```

292 {\ccIfProp{int-#2indent}
293   {\ccSetPropertyX{#2indent}{\ccUseProperty{int-#2indent}}}
294   {\ccSetProperty{#2indent}{\z@}}}%

```

the final value for `margin-left` is calculated. If no optional argument is given, the method called is the `\cc@calc@margin@left` macro, above.

```

295 #1{#2}{#3}}

```

This branch is reached when the left margin is not set to `auto`.

```

296 {\ccIfProp{int-#2margin-left}
297   {\ccIfPropVal{int-#2indent}{auto}

```

If `margin-left` is set to a specific value and `indent` is set to `auto`, set the actual indent to the width of the level's widest Number.

```

298 {\ccSetPropertyX{#2indent}{-\ccUseProperty{#2number-width-level-max}}}
299 {\ccIfProp{int-#2indent}

```

Otherwise, if `indent` is set to a specific width, apply that value, or else set the inden to `Opt`.

```

300     {\ccSetPropertyX{#2indent}{\ccUseProperty{int-#2indent}}}
301     {\ccSetProperty{#2indent}{\z@}}}}

```

If `margin-left` is not set,

```

302     {\ccIfPropVal{int-#2indent}{auto}

```

and `indent` is set to `auto`, set `margin-left` to the width of the level's widest Number and the actual `indent` to the negative of that.

```

303     {\ccPropertyLetX{#2margin-left}{#2number-width-level-max}%
304     \ccSetPropertyX{#2indent}{-\ccUseProperty{#2number-width-level-max}}}
305     {\ccIfProp{int-#2indent}

```

If `margin-left` is not set, and `indent` is set to a specific value, apply that value for `indent` and set `margin-left` to `Opt`. In this branch, `indent` should have a positive value, otherwise the content would probably lap over the left edge of the type area.

```

306     {\ccSetPropertyX{#2indent}{\ccUseProperty{int-#2indent}}%
307     \ccSetProperty{#2margin-left}{\z@}}

```

otherwise set both `indent` nad `margin-left` to `Opt`.

```

308     {\ccSetProperty{#2indent}{\z@}%
309     \ccSetProperty{#2margin-left}{\z@}}}}}}

```

3.4 Labelling and Cross referencing

CoCoT_EX provides two ways to put labels on Container instances: one via the label attribute at the begin of a (Sub-)Containers corresponding environment, or via the `RefLabel` Component inside the (Sub-)Container.

```

310 \AtBeginDocument{%

```

Storing the final definitions of `\label`

`\cc@ltx@label` stores the definition of LaTeX's `\label` macro at the beginning of the document.

```

311 \global\let\cc@ltx@label\label
312 }

```

`\ccCreateLabel` is a high level macro to generate hyperref anchors and/or ref targets.

`{#1}` is the type of anchor

This macro looks for both the label attribute in the begin of a Container's environment, as well as for a `RefLabel` Components inside the environment. If both exist, both apply. If none exists, we adopt the generic anchor point generated by the `hyperref` package.

TODO: Check if the hyperref macros need to be configured in any way for various reference types!

```

313 \def\ccCreateLabel#1{%
314   \ifx\Hy@MakeCurrentHrefAuto\@undefined\else
315     \Hy@MakeCurrentHrefAuto{cc:#1}%
316     \Hy@raisedlink{\hyper@anchorstart{\@currentHref}\hyper@anchorend}%
317   \fi
318   \let\cc@ref@label\relax
319   \ccWhenComp{RefLabel}

```

```

320   {\ccgdefFromComp\cc@ref@label{RefLabel}%
321    \expandafter\cc@create@label\expandafter{\cc@ref@label}}%
322   \ccIfAttr{\cc@cur@cont}{label}
323   {\cc@parse@csv\cc@create@label{\cc@\cc@cur@cont @attr@label}}%
324   {\ifx\cc@ref@label\relax\cc@create@label{\@currentHref}\fi}}

```

`\cc@create@label` generates the actual anchor for document-internal cross-references (i.e., a \LaTeX `\label`).

`{#1}` is the label ID

```

325 \def\cc@create@label#1{%
326   \ccIfComp{Number}
327   {\ifx\cc@labelname@comp\undefined
328     \def\cc@labelname@comp{Title}%
329     \fi
330     \begingroup
331     \ccGobble
332     \ccgdefFromComp\@currentlabel{Number}%
333     \ccgdefFromComp\@currentlabelname{\cc@labelname@comp}%
334     \endgroup}%
335   {\cc@fallback@anchor}%
336   %% leaving this will generate lots of "duplicate destination"
337   %% messages from pdfbackend
338   %\expandafter\hypertarget\expandafter{#1}{}%
339   \expandafter\label\expandafter{#1}%
340 }
341 \def\cc@fallback@anchor{\phantomsection}%

```

3.5 Linguistic Name generation and selection

`\ccSetBabelLabel` defined a language-dependent string macro for German and English varieties.

`{#1}` is the language

`{#2}` is the internal reference name

`{#3}` is the language specific label

```

342 \def\ccSetBabelLabel#1#2#3{%
343   \def\ccc@lang{#1}%
344   \expandafter\def\expandafter\ccc@tempa\expandafter{\expandafter\def\csname #2name\endcsname
345     {#3}}%
346   \ifdefstring\ccc@lang{german}{%
347     \expandafter\addto\expandafter\captionsgerman\expandafter{\ccc@tempa}%
348     \expandafter\addto\expandafter\captionsgerman\expandafter{\ccc@tempa}%
349   }\relax%
350   \ifdefstring\ccc@lang{english}{%
351     \expandafter\addto\expandafter\captionsbritish\expandafter{\ccc@tempa}%
352     \expandafter\addto\expandafter\captionbUKenglish\expandafter{\ccc@tempa}%
353     \expandafter\addto\expandafter\captionsenglish\expandafter{\ccc@tempa}%
354     \expandafter\addto\expandafter\captionssamerican\expandafter{\ccc@tempa}%
355     \expandafter\addto\expandafter\captionssUSenglish\expandafter{\ccc@tempa}%
356   }\relax%
357 }

```

3.6 Link Generation

`\ccCompLink` creates a hyperlink with the target taken from Component with the name `{#1}` and the label `{#2}`.

```

357 \def\ccCompLink#1#2{%
358   \protected@edef\@argi{\expandonce{\ccUseComp{#1}}}%
359   \expandafter\href\expandafter{\@argi}{#2}%
360 }

```

`\ccPageLabel` enables referencing pages via `\pageref` by using `\phantomsection` to create a hyperref anchor for label `{#1}`.

```

361 \def\ccPageLabel#1{\phantomsection\label{#1}}

```

```

</common>

```

Module 4

coco-accessibility.dtx

This file provides code for the interaction between the CoCoTeX framework and the `ltpdfa` package.

Please consider this module as highly experimental!

There are two files created from this dtx: one `coco-accessibility.sty` and one `coco-accessibility.lua`.

1 LaTeX code

```
<*ally-sty>
```

1.1 General Processing

The `coco-accessibility.sty` starts with some general package information like name, current version and date of last changes.

```

23 %%
24 %% Accessibility features for \textit{xerif} projects.
25 %%
26 %% Maintainer: p.schulz@le-tex.de
27 %%
28 %% lualatex - texlive > 2018
29 %%
30 \NeedsTeXFormat{LaTeX2e}[2018/12/01]
31 \ProvidesPackage{coco-accessibility}
32   [2024/03/23 0.4.1 CoCoTeX accessibility module]
33 \RequirePackage{kvoptions-patch}
34 \RequirePackage{xkeyval}
35 \RequirePackage{atbegshi}
36 \RequirePackage{xparse}

```

The `ltpdfa` package re-defines too many standard LaTeX macros, so we only use its lua code and define the interface ourselves. For that, we use `etoolbox`'s patch commands to inject our tagging code into the standard macros rather than to create hard copies. This should increase compatibility with other packages and make all our lives easier.

We start with adopting `ltpdfa`'s package options.

`\cca@lang@id` is the ISO 639-2 code for the document's main language. As default, we assume Modern English.

```

37 \def\cca@lang@id{eng}%
38 \DeclareOptionX{lang-id}{\gdef\cca@lang@id{#1}}

39 \DeclareOptionX{init}{\global\let\cc@do@ally\relax}

```

`\cca@do@nodetree` if `\relax`, show the node tree in the log and in the shell output.

```
40 \DeclareOptionX{nodetree}{\let\cca@do@nodetree\relax}
```

`\cca@do@showspaces` if `\relax`, show spaces in the pdf.

```
41 \DeclareOptionX{show-spaces}{\let\cca@do@showspaces\relax}
```

`\cca@do@dospaces` if `\relax`, add ASCII space characters to the PDF. L^AT_EX doesn't write physical spaces into the output document but moves letters via skips, which allows variable word spacing beyond a font's space width definition, but it is a hard barrier for screen readers which rely on real space characters. This options causes the `ltpdfa` package to insert real space characters that are immediately followed by a negative skip by the font-dependent width of that space to keep L^AT_EX's typeface intact. This is activated by default.

```
42 \let\cca@do@dospaces\relax
43 \DeclareOptionX{no-spaces}{\let\cca@do@dospaces\@undefined}
```

`\cca@do@doparas` if `\relax`, add paragraph tagging.

```
44 \let\cca@do@doparas\relax
45 \DeclareOptionX{no-paras}{\let\cca@do@doparas\@undefined}
```

Processing the options.

```
46 \ProcessOptionsX
```

`\cca@patch@error` is a generic error message that is thrown whenever a L^AT_EX kernel macro could not be patched. This is usually the case when the macro definition does not match coco-accessibility's expectation, e.g., when another package messes with the macro's original definition. #1 is the CS token of the un-patchable macro.

```
47 \def\cca@patch@error#1{%
48   \ccPackageError{ally}{compatibility}
49   {Could not patch \noexpand#1}
50   {You probably use a LaTeX package that re-defines the \noexpand#1 control sequence. It is
     apparently not compatbile with coco-accessibility.sty. Sorry}}
```

1.2 Activating and Deactivating Accessibility Features

`\ccIfAlly` is a switch to distinct between compilation with (implicit #1) or without (implicit #2) activated accessibility features.

```
51 \def\cc@if@ally{\ifx\cc@do@ally\relax\expandafter\@firstoftwo\else\expandafter\@secondoftwo\fi}
52 \let\ccIfAlly\cc@if@ally
```

`\ccWhenAlly` is a variant of `\ccIfAlly` that omits the else branch.

```
53 \def\ccWhenAlly{\ifx\cc@do@ally\relax\expandafter\@firstofone\else\expandafter\@gobble\fi}
```

1.3 Accessibility-specific additions

Loading Further Dependencies

Activated coco-accessibility requires two packages: `luatexbase-attr` (possibly deprecated?) provides an interface to add attributes to lua code; `atveryend` provides a hook to inject code to the final stages of PDF rendering.

```

54 \ccWhenAlly{%
55   \ifluatex\else
56     \ccPackageError{a11y}{engine}
57     {accessibility features require luatex!}
58     {You tried to use the accessibility features of CoCoTeX with an other TeX engine than
59       luatex. This will not work; luatex is a hard requirement. Sorry.}
60   \fi
61   \RequirePackage{luatexbase-attr}
62   \RequirePackage{atveryend}

```

Additional Hyperref Setup

Additional hyperref setup to be executed at the very end of the preamble.

```

62 \AtBeginDocument{%
63   \hypersetup{%
64     % pdfa=true% already set elsewhere
65     ,unicode=true%
66     ,pdfinfo={}%
67     % ,pdfpagelabels=true% already set elsewhere
68     ,pageanchor=true%
69   }%
70   \Hy@pdfatrue
71 }

```

Loading and Configuring ltpdfa's Lua Modules

Now, we set the configuration of the `ltpdfa` lua facility by passing some of the `coco-accessibility` package options:

```

72 \directlua{ltpdfa = require('ltpdfa')}
73 \directlua{ltpdfa.config.final = true}
74 \directlua{ltpdfa.config.debug = \ifcc@debug true\else false\fi}
75 \directlua{ltpdfa.config.nodetree = \ifx\cca@do@nodetree\relax true\else false\fi}
76 \directlua{ltpdfa.config.showspace = \ifx\cca@do@showsplaces\relax true\else false\fi}
77 \directlua{ltpdfa.config.dospaces = \ifx\cca@do@dospaces\relax true\else false\fi}
78 \directlua{ltpdfa.config.doparas = \ifx\cca@do@doparas\relax true\else false\fi}

```

`ltpdfa` provides two ways to tag heading heads. One by tagging headers as `H1..H6`, and one where all headings are tagged as `H` and a heading's depth is implied by nesting. Since most of our projects require way more than 6 heading levels, we hard-code the nesting approach:

```

79 \directlua{ltpdfa.config.headnums = false}

```

CoCoTeX with accessibility support is `\luaTeX` only, so we hard-code `pdfTeX` as render engine:

```

80 \directlua{ltpdfa.config.driver = "\luaescapestring{pdfTeX}"}
81 \directlua{ltpdfa.config.lang = '\luaescapestring{\cca@lang@id}'}
82 \directlua{ltpdfa.init()}%

```

Initial setup of `ltpdfa`

```

83 \edef\@ltpdfa@pattr{\directlua{ltpdfa.getAttribute('\luaescapestring{parentattr}')}}
84 \edef\@ltpdfa@tattr{\directlua{ltpdfa.getAttribute('\luaescapestring{typeattr}')}}
85 \attributedef\@ltpdfa@typeattr=\@ltpdfa@tattr
86 \attributedef\@ltpdfa@parentattr=\@ltpdfa@pattr
87 \def\ltpdfa@last@page{\ifx\r@LTLastPage\undefined\@empty\else\expandafter\@secondoftwo\r@LTLastPage\fi}%

```

We need the absolute last page of the document

```
88 \AfterLastShipout{\immediate\write\@mainaux{\string\newlabel{LTLastPage}{\LTLastPage}{\
    directlua{ltpdfa.getPageNum()}}}}}%
89 }%/ccWhenAlly
```

1.4 Generic Macro to Declare Accessibility Features

In order to selectively enable and disable accessibility macros during runtime, we need each tagging markup macro to exist in two states, one where they trigger tagging into the pdf, and one where they do nothing.

The enabled and disabled versions of each macro are stored inside two separate lists:

`\cca@relaxed@defs` is the list that stores the *disabled* ltpdfa interface command variants,

```
90 \def\cca@relaxed@defs{}
```

and

`\cca@saved@defs` is a list that stores the *enabled* ltpdfa interface command variants.

```
91 \def\cca@saved@defs{}
```

The next two macros are used to disable and enable accessibility markup:

`\ccaDisable` disables all ltpdfa commands

```
92 \def\ccaDisable{\cca@relaxed@defs}
```

and

`\ccaEnable` enables all ltpdfa commands.

```
93 \def\ccaEnable{\cca@saved@defs}
```

`\CsToStr` is a xparse helper macro which returns the name of a control sequence #1.

```
94 \ExplSyntaxOn
95 \newcommand{\CsToStr}[1]{\cs_to_str:N #1}
96 \ExplSyntaxOff
```

`\DeclareAccessibilityCommand` is the wrapper for our interface macros. It has the same argument signature as L^AT_EX's `\newcommand*`, albeit without the whole checking for already defined control sequences.

```
97 \def\DeclareAccessibilityCommand#1{\@ifnextchar[{\cca@declare@cmd@firstopt#1}{\cca@declare@cmd
    #1}}}%]
```

First, we need to take care of the optional arguments:

`\cca@temp@signature` is the temporary storage for the argument signature.

```
98 \let\cca@temp@signature\@empty
```

`\cca@declare@cmd@firstopt` is the handler for the first optional argument, which holds the overall number of the arguments of our interface macro:

```
99 \def\cca@declare@cmd@firstopt#1[#2]{\edef\cca@temp@signature{[\unexpanded{#2}]]}%
100 \@ifnextchar[{\cca@declare@cmd@secopt#1}{\cca@declare@cmd#1}}}%]
```

`\cca@declare@cmd@secopt` is the handler for the second optional argument, which indicates that the first of the first-level arguments is optional and which itself holds the default value for that optional argument. Its unexpanded value is added to the argument signature.

```
101 \def\cca@declare@cmd@secopt#1[#2]{\eappto\cca@temp@signature{\unexpanded{#2}}}\cca@declare@cmd
    #1}
```

`\cca@declare@cmd`, eventually, is the actual wrapper for the newcommand calls.

```
102 \def\cca@declare@cmd#1#2{%
```

First, we create a string `\savedDef` that includes the *active* definition of our interface macro and store it in an internal macro named `\cc@saved@#1`. This macro is immediately called.

```
103 \edef\savedDef{\noexpand\newcommand*\expandafter\noexpand\csname cc@saved@\CsToStr{#1}\
    endcsname\expandonce{\cca@temp@signature}{\unexpanded{#2}}}\savedDef%
```

Then, we create a `\let` sequence that maps the plain CS name `#1` onto that newly created internal macro. The String containing the let-sequence is then stored in the `\cca@saved@defs` list, so whenever this list is expanded, the desired CS-token ‘`#1`’ is defined to the active definition.

```
104 \edef\x{\noexpand\let\noexpand#1\expandafter\noexpand\csname cc@saved@\CsToStr{#1}\endcsname}%
105 \global\expandafter\appto\expandafter\cca@saved@defs\expandafter{x}%
```

Then, we repeat the same procedure, but this time, we define the whole internal CS token with the same argument structure to expand to `\relax`.

```
106 \edef\relaxDef{\noexpand\newcommand*\expandafter\noexpand\csname cc@no@\CsToStr{#1}\endcsname\
    expandonce{\cca@temp@signature}{\relax}}\relaxDef%
```

The whole `\let` sequence for the `\relax` version of our internal macro is then stored in the `\cca@relaxed@defs` list.

```
107 \edef\y{\noexpand\let\noexpand#1\expandafter\noexpand\csname cc@no@\CsToStr{#1}\endcsname}%
108 \expandafter\appto\expandafter\cca@relaxed@defs\expandafter{y}%
```

Now, we can decide which of the two `\let`-sequences should be the used to define the initial value of the `#1` CS token, depending on the value of the `\ccIfAlly` conditional:

```
109 \ccIfAlly{x}{y}%
```

Finally, we reset the temporary argument signature macro.

```
110 \let\cca@temp@signature\@empty
111 }
```

Some macros from `ltpdfa.sty`:

```
112 \DeclareAccessibilityCommand{\ccaAddToConfig}[2]{\directlua{ltpdfa.addToConfig('\luaescapestring
    {#1}','\luaescapestring{#2}')}}
113 \@onlypreamble\ccaAddToConfig
```

`\ccaStructStart` inserts a structural tag with the name `#2`. Optional `#1` is the name of a forced parent.

This tagging macro inserts `\bgroup` at the start of the tagged area.

```
114 \DeclareAccessibilityCommand{\ccaStructStart}[2][\ifcc@is@final\directlua{ltpdfa.tagger.
    structStart('\luaescapestring{#2}','\luaescapestring{#1}')}\fi}
```

`\ccaStructEnd` inserts the an `\egroup` and an end tag with the name #1.

```
115 \DeclareAccessibilityCommand{\ccaStructEnd}[1]{\ifcc@is@final\directlua{lua.pdf.a.tagger.structEnd
    ('\luaescapestring{#1}')}\fi}
```

`\ccaVstructStart` is the same as `\ccaStructStart`, but without inserting a group at the beginning of the tagging area.

```
116 \DeclareAccessibilityCommand{\ccaVstructStart}[2][]{\ifcc@is@final\directlua{lua.pdf.a.tagger.
    vstructStart('\luaescapestring{#2}','\luaescapestring{#1}')}\fi}
```

`\ccaVstructEnd` ends an ungrouped tagging area. #1 is the name of the tag.

```
117 \DeclareAccessibilityCommand{\ccaVstructEnd}[1]{\ifcc@is@final\directlua{lua.pdf.a.tagger.
    vstructEnd('\luaescapestring{#1}')}\fi}
```

`\ccaPstructStart` is the same as `\ccaStructStart` but no grouping and no setting of any attributes applies. Implies that the element has no content children, at all.

```
118 \DeclareAccessibilityCommand{\ccaPstructStart}[2][]{\directlua{lua.pdf.a.tagger.pstructStart('\
    luaescapestring{#2}','\luaescapestring{#1}')}}
```

`\ccaPstructEnd` ends an unattributed tagging area.

```
119 \DeclareAccessibilityCommand{\ccaPstructEnd}[1]{\directlua{lua.pdf.a.tagger.pstructEnd('\
    luaescapestring{#1}')}}
```

`\ccaGetCurStruct` returns the internal ID of the currently open structural element. #1 is table attribute that should be returned. The following code gives an example on how to use the macro:

```
\ccaStructStart{Leela}
\edef\LeelaID{\ccaGetCurStruct{idx}}%
\ccaStructEnd{Leela}
```

This stores the internal node index of the `Leela` tag node in the `\LeelaID` macro so it can be referenced by other lua interface macros like `\ccaAddToStruct` or `\ccaMoveStruct`, as shown below.

```
120 \DeclareAccessibilityCommand{\ccaGetCurStruct}[1]{\directlua{lua.pdf.a.tagger.getCurrentStruct('\
    luaescapestring{#1}')}}
```

`\ccaAddToStruct` adds the current structural element to the structural element #1 previously retrieved using `\ccaGetCurStruct`, e.g.,

```
% \ccaStructStart{Fry}
% \edef\FryID{\ccaGetCurStruct{idx}}%
% \ccaStructEnd{Fry}
% \ccaStructStart{Hubert}
% \ccaAddToStruct{\CurrentNode}%
% \ccaStructEnd{Hubert}
```

makes `Hubert` into a child node of `Fry` and detaches it from its current parent node (which, in this case, is also the current parent of `Foo`). Note that the parent has to be tagged *before* the child node.

```
121 \DeclareAccessibilityCommand{\ccaAddToStruct}[1]{\directlua{lua.pdf.a.tagger.addToStruct('\
    luaescapestring{#1}')}}
```

`\ccaMoveStruct` removes the Node with the ID #1 from its current parent and attaches it as child to the current node. `\ccaMoveStruct` is the logical counter-part of above's `\ccaAddToStruct`. The child's node ID can be retrieved with the `\ccaGetCurrentStruct` command, for example:

```
\ccaStructStart{Hubert}
  \xdef\HubertID{\ccaGetCurStruct{idx}}
\ccaStructEnd{Hubert}
\structStart{Fry}
  \ccaMoveStruct{\HubertID}
\structEnd{Fry}
```

This will make **Hubert** a child of **Fry**. In contrast to `\ccaAddToStruct`, this allows to attach a previously tagged child node to a later tagged parent node.

```
122 \DeclareAccessibilityCommand{\ccaMoveStruct}[1]{\relax\directlua{ltpdfa.tagger.moveStruct('\luaescapestring{#1}')}}}
```

`\ccaReplaceStruct` takes a previously added tag node with the index #1 and *replaces* it with the current tag node.

```
123 \DeclareAccessibilityCommand{\ccaReplaceStruct}[1]{\relax\directlua{ltpdfa.tagger.replaceStruct('\luaescapestring{#1}')}}}
```

`\ccaAddID` renames the index attribute of the current tag node to #1. If #1 is “auto”, the index is calculated by ltpdfa.

```
124 \DeclareAccessibilityCommand{\ccaAddID}[1]{\directlua{ltpdfa.tagger.addID('\luaescapestring{#1}')}}}
```

`\cca@set@docinfo` sets the PDF docinfo. #2 is a key, #3 is the value, optional #1 is an encoding.

```
125 \DeclareAccessibilityCommand{\ccaSetDocinfo}[3][\directlua{ltpdfa.setDocInfo('\luaescapestring{#2}', '\luaescapestring{#3}', '\luaescapestring{#1}')}}}
```

`\ccaAddRolemap` is used to map a custom LaTeX tag to a well-defined PDF tag. #1 is the name of the LaTeX Tag, #2 is the name of the PDF role.

```
126 \DeclareAccessibilityCommand{\ccaAddRolemap}[2]{\directlua{ltpdfa.tagger.addRolemap('\luaescapestring{#1}', '\luaescapestring{#2}')}}}
```

`\ccaAddPlacement` tells the tagger if a floating object is placed as a “Block” or “Inline”.

```
127 \DeclareAccessibilityCommand{\ccaAddPlacement}[1]{\directlua{ltpdfa.tagger.addPlacement('\luaescapestring{#1}')}}}
```

`\ccaAddNumbering` ???

```
128 \DeclareAccessibilityCommand{\ccaAddNumbering}[1]{\directlua{ltpdfa.tagger.addNumbering('\luaescapestring{#1}')}}}
```

1.5 Lua injection

Some features are realized by Lua code, so we tell LuaLaTeX to include the code that is generated from material later in this source file:

```
129 \ccWhenAlly{\directlua{ally = require('coco-accessibility')}}}
```

1.6 Hyperlink handling

To tag hyperlinks, we define some ltpdfa interface macros.

`\ccaAddAltText` is used to add an Alternative Text node, given in #1, to the PDF structTree.

```
130 \DeclareAccessibilityCommand{\ccaAddAltText}[1]{\directlua{ltpdfa.tagger.addAltText('\'
    luaescapestring{#1}')}}}
```

`\ccaAddLastLink` adds the last Link node to the PDF structTree.

```
131 \DeclareAccessibilityCommand{\ccaAddLastLink}{\directlua{ltpdfa.tagger.addLastLink()}}
```

`\ccaGetStructParent` returns the current parent structure. This is needed in case a link breaks across columns (or pages).

```
132 \DeclareAccessibilityCommand{\ccaGetStructParent}{\directlua{ltpdfa.tagger.getStructParent()}}
```

We prepare the link interface macros to be patched into `hyperref` at the begin document hook if accessibility features are activated.

First we add the start tag for a Link node.

```
133 \begingroup
134 \@makeother\#
135 \ccWhenAlly{%
136 \AtBeginDocument{%
137   \patchcmd\Hy@StartlinkName
138     {\pdfstartlink}
139     {\ccaStructStart{Link}\ccaAddAltText{#2}\edef\@ltpdfmy@parent{\ccaGetStructParent}%
140       \pdfstartlink}
141     }{\cca@patch@error\Hy@StartlinkName}
```

and the parent node inside the link attribute:

```
142   \patchcmd\Hy@StartlinkName
143     {#1}
144     {#1 /StructParent \@ltpdfmy@parent}
145     }{\cca@patch@error\Hy@StartlinkName}
```

then we patch `hyperref`'s general link macro, twice. Once for the Link's start tag

```
146   \patchcmd\hyper@linkurl
147     {\pdfstartlink}
148     {\ccaStructStart{Link}\ccaAddAltText{#2}\edef\@ltpdfmy@parent{\ccaGetStructParent}%
149       \pdfstartlink}
150     }{\cca@patch@error\hyper@linkurl}
```

and secondly for the Parent:

```
151   \patchcmd\hyper@linkurl
152     {/C[\@urlbordercolor]%
153     \fi
154     }
155     {/C[\@urlbordercolor]%
156     \fi
157     /StructParent \@ltpdfmy@parent%
158     }{\cca@patch@error\hyper@linkurl}
```

finally, we patch the end tag for the link node into the `\close@pdflink` macro:

```

159 \patchcmd\close@pdflink
160 {\pdfendlink}
161 {\pdfendlink
162   \ccaAddLastLink\ccaStructEnd{Link}}
163 {}{\cca@patch@error\close@pdflink}

```

For internal references, we patch the tagging into the `\@setref` macro. Unfortunately, `hyperref` redefines this macro and links to both the original version (when `\ref*` is used), and its own re-definition (else), so we need to patch both versions. We start by resetting `\@setref` to its vanilla state and inject our tagging, once for the start tag and a second time for the end tag:

```

164 \let\cca@hy@setref\@setref
165 \let\@setref\real@setref
166 \patchcmd\@setref
167   {\else}
168   {\else\ccaStructStart{Reference}}
169   {}{\cca@patch@error\orig@setref@new}%
170 \patchcmd\@setref
171   {\fi}
172   {\ccaStructEnd{Reference}\fi}
173   {}{\cca@patch@error\orig@setref@new}%

```

Now, we restore `hyperref`'s version and inject the tagging there as well:

```

174 \let\real@setref\@setref
175 \let\@setref\cca@hy@setref
176 \patchcmd\@setref
177   {\expandafter\Hy@setref@link}
178   {\ccaStructStart{Reference}\expandafter\Hy@setref@link}
179   {}{\cca@patch@error\@setref}
180 \patchcmd\@setref
181   {{#2}}
182   {{#2}\ccaStructEnd{Reference}}
183   {}{\cca@patch@error\@setref}
184 }% /AtBeginDocument
185 }% /ccWhenAlly
186 \endgroup

```

1.7 Tagging Page Styles as Artifacts

Page styles, i.e., headers and footers, need to be tagged as artifacts unless they contain semantic information. To avoid inserting the tagging by hand into each publisher's page style definitions, we inject the tagging automatically by using `etoolbox`'s patch commands to insert the start and end tags inside the internal header and footer macros, respectively.

`\ccaPagestyleArtifacts` contains the code to patch the `\@oddhead`, `\@evenhead`, `\@oddfoot` and `\@evenfoot` macros.

```

187 \DeclareAccessibilityCommand{\ccaPagestyleArtifacts}{%
188   \ifx\@oddhead\@empty\else
189     \pretocmd\@oddhead{\ccaStructStart[document]{header}}{}{}%
190     \apptocmd\@oddhead{\ccaStructEnd{header}}{}{}%
191   \fi
192   \ifx\@evenhead\@empty\else
193     \pretocmd\@evenhead{\ccaStructStart[document]{header}}{}{}%
194     \apptocmd\@evenhead{\ccaStructEnd{header}}{}{}%
195   \fi

```

```

196 \ifx\@oddfoot\@empty\else
197   \pretocmd\@oddfoot{\ccaStructStart[document]{footer}}{}{}%
198   \apptocmd\@oddfoot{\ccaStructEnd{footer}}{}{}%
199 \fi
200 \ifx\@evenfoot\@empty\else
201   \pretocmd\@evenfoot{\ccaStructStart[document]{footer}}{}{}%
202   \apptocmd\@evenfoot{\ccaStructEnd{footer}}{}{}%
203 \fi}

```

The standard pagestyles from the L^AT_EX kernel are patched by the module.

```

204 \apptocmd\ps@empty{\ccaPagestyleArtifacts}{}{}
205 \apptocmd\ps@plain{\ccaPagestyleArtifacts}{}{}
206 \apptocmd\ps@headings{\ccaPagestyleArtifacts}{}{}
207 \apptocmd\ps@myheadings{\ccaPagestyleArtifacts}{}{}

```

Finally, we register the `footer` and `header` PDF tags as `artifacts` with `ltpdfa`:

```

208 \ccWhenAlly{%
209   \ccaAddToConfig{artifact}{header={Type:Pagination}{Subtype:Header}}
210   \ccaAddToConfig{artifact}{footer={Type:Pagination}{Subtype:Footer}}

```

1.8 generic artifacts

```

211 \ccaAddToConfig{artifact}{leaders={Type:Layout}}
212 \ccaAddToConfig{artifact}{footnoterule={Type:Layout}}
213 \ccaAddToConfig{artifact}{Rule={Type:Layout}}
214 \ccaAddToConfig{artifact}{Artifact={Type:Layout}}
215 }

```

1.9 Tagging for Floats

Taggin for Figures

`\ccaAddFigure` #1, #2, #3, and #4 are the x and y coordinates of the image, first x and y of the lower left corner, then x and y of the upper right corner; #5 and #6 are the x and y scales, respectively; and #7 is “true” or “false” depending on whether or not the clipping option is active.

```

216 \DeclareAccessibilityCommand{\ccaAddFigure}[7]{\directlua{ltpdfa.tagger.addFigure(
217   '\luaescapestring{#1}',
218   '\luaescapestring{#2}',
219   '\luaescapestring{#3}',
220   '\luaescapestring{#4}',
221   '\luaescapestring{#5}',
222   '\luaescapestring{#6}',
223   '\luaescapestring{#7}')}}

```

`\ccaFigureStart` injects the starting tag for images to the pdf

```

224 \DeclareAccessibilityCommand{\ccaFigureStart}[1]{\directlua{ltpdfa.tagger.figureStart('\luaescapestring{#1}')}}

```

`\ccaFigureEnd` injects the ending tag for images

```

225 \DeclareAccessibilityCommand{\ccaFigureEnd}[1]{\directlua{ltpdfa.tagger.figureEnd('\luaescapestring{#1}')}}

```

which we add to the beginning and the end of `graphics` package's `\Gininclude@graphics` macro, respectively.

```

226 \AtBeginDocument{%
227   \ifcc@modern
228     \let\ltx@Gincludel@graphics\Gininclude@graphics
229     \def\Gininclude@graphics#1{\ifcc@is@final\ccaFigureStart{}\fi\ltx@Gincludel@graphics{#1}\
      ifcc@is@final\ccaFigureEnd{}\fi}%
230   \else
231     \ifpackageloaded{grffile}
232       {\pretocmd\grffile\Gininclude@graphics{\ifcc@is@final\ccaFigureStart{}\fi}{}}%
233       \apptocmd\grffile\Gininclude@graphics{\ifcc@is@final\ccaFigureEnd{}\fi}{}}%
234       {\pretocmd\Gininclude@graphics{\ifcc@is@final\ccaFigureStart{}\fi}{}}%
235       \apptocmd\Gininclude@graphics{\ifcc@is@final\ccaFigureEnd{}\fi}{}}%
236   \fi
237 }

238 \apptocmd\Gininclude@pdftex{\ifcc@is@final%
239   \def\@tempa{!}%
240   \ccaAddFigure{\Gin@llx}{\Gin@lly}{\Gin@urx}{\Gin@ury}
241   {\ifx\Gin@scalex\@tempa\else \Gin@scalex\fi}
242   {\ifx\Gin@scaley\@tempa\else \Gin@scaley\fi}
243   {\ifGin@clip true\else false\fi}\fi}%rwi/rhi
244   {}{}
245 \AtBeginDocument{%
246   \ifpackageloaded{htmltabs}{%
247     \let\ltx@ht@valign@box\ht@valign@box
248     \def\ht@valign@box{\ifht@final@render\cc@is@finaltrue\fi\ltx@ht@valign@box}
249     \let\ltx@ht@RenderCell\ht@RenderCell
250     \def\ltx@ht@RenderCell{\cc@is@finalfalse\ltx@ht@RenderCell}}{}

```

Tagging for Tables

`\ccaAddScope` is used to indicate the scope of in table's head cells. The value should be either `Column` or `Row`.

```

251 \DeclareAccessibilityCommand{\ccaAddScope}[1]{\relax\directlua{ltpdfa.tagger.addScope('\
      luaescapestring{#1}')}}

```

`\ccaAddColSpan` is used to mark a cell to span horizontally over #1 columns (including it's own).

```

252 \DeclareAccessibilityCommand{\ccaAddColSpan}[1]{\relax\directlua{ltpdfa.tagger.addColSpan('\
      luaescapestring{#1}')}}

```

`\ccaAddRowSpan` is used to mark a cell to span vertically over #1 rows (including it's own).

```

253 \DeclareAccessibilityCommand{\ccaAddRowSpan}[1]{\relax\directlua{ltpdfa.tagger.addRowSpan('\
      luaescapestring{#1}')}}

```

`\ccaAddKeep` is inserted into empty cells to tell the ltpdfa-tagger to not remove the Tag even though it may be empty.

```

254 \DeclareAccessibilityCommand{\ccaAddKeep}{\relax\directlua{ltpdfa.tagger.addKeep()}}

```

1.10 Transformation of Typographic Unicode characters

In order for screen readers to work correctly, some unicode characters that mask purely typographic glyphs (e.g., ligatures) need to be mapped to their underlying orthographic characters. This is done via pdfTeX's `glyphtounicode` tables:

```

255 \ifx\pdfextension\@undefined\else
256 \protected\def\pdfglyphtounicode{\pdfextension glyphtounicode}
257 \input glyphtounicode
258 \edef\pdfgentounicode{\pdfvariable gentounicode}
259 \pdfgentounicode = 1
260 \fi

```

1.11 Automatic PDF Tagging

Document Root Node

The following code causes the `ltpdfa` package to tag the `document` environment as the structural representation's root node:

```

261 \ccWhenAlly{%
262   \ccDeclareHook[document]{cca/at/begin/document}
263   \AtBeginDocument{%
264     \directlua{ltpdfa.beginDocument('\luaescapestring{\ltpdfa@last@page}')}
265     \ccUseHook[document]{cca/at/begin/document}%
266     \directlua{ltpdfa.configAutoclose()}
267     \ccaVstructStart{document}%
268   }
269   \AtEndDocument{%
270     \ccaVstructEnd{document}
271     \directlua{ltpdfa.endDocument()}%
272   }
273 }

```

1.12 Default Role Mapping

Note that this section contains only the role mappings that didn't thematically fit into other CoCoT_EX modules.

```

274 \ccaAddRolemap{document}{Document}
275 \ccaAddRolemap{Para}{P}

```

Finally, we hook `ltpdfa`'s page processor into `AtBeginShipoutBox`:

```

276 \ccWhenAlly{\AtBeginShipout{\directlua{ltpdfa.pageprocessor(tex.box["AtBeginShipoutBox"])}}}%

```

End of T_EX source code.

```
</a11y-sty>
```

2 Lua code

```
<*a11y-lua>
```

2.1 Local Variables and Tables

`ltpdfa` is an instance of the `ltpdfa` Lua table.

```
279 local ltpdfa = require('ltpdfa')
```

2.2 Meta Data Extraction

`meta` is a table that holds the metadata that are extracted from the `\jobname.xmp` file via its `extract` member.

```
280 local meta = {
281   Author = '',
282   Title = '',
283   Creator = '',
284   Producer = '',
285   Keywords = '',
```

The method `meta.extract()` reads the meta data from the `\jobname.xmp` and stores certain values to be accessed by LaTeX. This is used to fill the DocumentInfo when a xmp file is available during the expansion of `\cct@write@pdf@meta` from the `coco-title` module (see Sect. 2).

```
286 extract = function ()
287   local xmpfile = ltpdfa.metadata.xmphandler.fromFile(ltpdfa.config.metadata.xmpfile)
288   local f = io.open(xmpfile, "r")
289   local content = f:read("*all")
290   f:close()
291   if (content:find('<dc:title>')) then
292     Title = content:gsub('.*<dc:title>[~<]*<rdf:Alt>[~<]*<rdf:li[~>]*>(.*)</rdf:li>[~<]*</rdf:
      Alt>[~<]*</dc:title>.*', "%1")
293     -- log(">>>" .. meta.Title)
294   end
295   local authors
296   local author = {}
297   if (content:find('<dc:creator>')) then
298     authors = content:gsub('.*<dc:creator>[~<]*<rdf:Seq>(.*)</rdf:Seq>[~<]*</dc:creator>.*', "
      %1")
299     for k in string.gmatch(authors, "<rdf:li>([~>]+)</rdf:li>") do
300       table.insert(author, k)
301     end
302     Author = table.concat(author, ', ')
303   end
304 end
305 }
```

2.3 Public Methods

`cocotex` is the base table that contains all public methods and sub-tables available in the CoCoTeX framework. Here, it is defined unless it is already defined elsewhere.

```
306 if type(cocotex) ~= 'table' then
307   cocotex = {}
308 end
```

`cocotex.ally` is a globally available namespace for coco-accessibility specific lua tables.

```
309 cocotex.ally = {
310   meta = meta
311 }
```

After loading `coco-accessibility.lua` via the `require()` method, a `cocotex.ally` table is returned.

```
312 return cocotex.ally
```

no more lua code.

```
</a11y-lua>
```

Module 5

coco-meta.dtx

```
<*meta>
```

This file provides some macros that are used to process meta data, both for the whole document, as well as parts of a document.

File preamble

```
23 %%
24 %% module for CoCoTeX that provides handling of a document's meta data.
25 %%
26 %% Maintainer: p.schulz@le-tex.de
27 %%
28 %% lualatex - texlive > 2019
29 %%
30 \NeedsTeXFormat{LaTeX2e}[2018/12/01]
31 \ProvidesPackage{coco-meta}
32   [2024/03/23 0.4.1 CoCoTeX meta module]
33 \RequirePackage{coco-common}
```

CommonMeta is an abstract Container for commonly used meta data, both for whole documents as well as parts of documents.

```
34 \ccDeclareContainer{CommonMeta}{%
35   \ccDeclareType{Components}{%
36     \ccDeclareRole{author}{Author}%
37     \ccm@declare@comp
38     \ccm@extended@common@macros
39     \ccm@declare@affils
40   }%
41   \ccDeclareType{Properties}{}%
42 }
```

1 Counted Container Handlers

1.1 Generic Blocks

`\ccm@generic@comp` is used to define a generic meta data block. It provides two Components for each instance, one for the block's Heading and one for its Content.

```
43 \def\ccm@generic@comp{%
44   \ccDeclareComponent{GenericMetaBlock}{\expandafter\global}{}%
45   \ccDeclareComponentGroup{GenericMeta}{%
46     \ccDeclareCountedComponent{Heading}%
47     \ccDeclareCountedComponent{Content}%
48   }}
```

`\ccm@generic@eval` evaluates the Components and tells the Framework how the generic counted Sub-Containers should be rendered.

```

49 \def\ccm@generic@eval{%
50   \def\cc@cur@cont{titlepage}%
51   \ccComposeCollection{GenericMeta}{generic-meta-format}{GenericMetaBlock}
52 }%

```

1.2 Contributor Roles

Contributors are counted sub-containers that represent the meta-data of people that share a role in contributing content to a document. Examples for such roles are an article/chapter/book's authors, or a collection/series' editors.

`\ccDeclareRole` is used to declare the Components that belong to each member of a contributor role. #2 is the name of the role, optional #1 is the internal name of the Role's formatting Property. If omitted, it is the same as #2.

The output of all members of a role is controlled by a Component called “`<role>NameList`” that is formatted according to the `<role>-format` Property. For reasons of naming conventions, the role names for a Component and its respective Property do not necessarily need to be identical.

```

53 \def\ccDeclareRole{\cc@opt@second\cc@declare@role}%
54 \def\cc@declare@role[#1]#2{%
55   \ccDeclareComponentGroup{#2}{%
56     \ccDeclareCountedComponent{FullName}%
57     \ccDeclareCountedComponent{CiteName}%
58     \ccDeclareCountedComponent{ShortCiteName}%
59     \ccDeclareCountedComponent{PDFInfoName}%
60     \ccDeclareCountedComponent{Initial}%

```

`\ccAddToRole` appends another Component declaration block #2 to a pre-defined Role #1.

```

90 \def\ccAddToRole#1#2{%
91   \csgappto{@#1@hook}{#2}%
92 }

```

`\ccDeclareRoleBlock` is used to create a new output container (named `\ccPrefix#2#3`) for a given Role #2. A Role Block is a Component of the parent Container which contains certain Components of all members of the Role within its parent Container. Format and selection of the utilised Components are specified via the Property given in #4. The optional argument #1 tells the evaluator in the Container's `end` macro how the collector is to be composed. Valid values are `compose` (default) or `apply`.

```

93 \def\ccDeclareRoleBlock{\@ifnextchar[\cc@declare@role@block{\cc@declare@role@block[compose]}}%
94 \def\cc@declare@role@block[#1]#2#3#4{%
95   \ifcsdef{ccm@role@#1}
96     {\ccDeclareComponent{#2#3}{\expandafter\global}{}%
97      \csgdef{ccm@role@\cc@cur@cont @#2@#3}{#4}%
98      \csappto{ccm@role@eval@\cc@cur@cont @#2}
99        {\csname ccm@role@#1\endcsname{#2}{#3}}}
100   {\ccPackageError{Meta}{Argument}
101     {Invalid optional argument in \string\ccDeclareRoleBlock!}
102     {Only 'apply' or 'compose' are allowed as values~^Jin the optional argument of \string\
      ccDeclareRoleBlock!}}}%

```

`\ccm@role@eval` creates the name lists for the role. #1 is the name of the role.

```

103 \def\ccm@role@eval#1{\csname @ccm@role@eval@\cc@cur@cont @#1\endcsname}

```

`\ccm@eval@role` #1 is the name of the macro used to compose the Collection (either `\ccComposeCollection`, or `\ccApplyCollection`), #2 is the name of the role and #3 is the name of the list. The access Component is #2#3, i.e., both arguments together.

```

104 \def\ccm@eval@role#1#2#3{%

```

First, we check if the Collection Component has already been set in the input. If so, we set an internal flag to indicate that the Collection Component has been filled manually.

```

105 \ccIfComp{#2#3}{\cslet{cc@used@#2#3@override}\@empty}{%

```

Second, we check if the counter for the Role is defined and greater than 0. If neither is the case, this means that the Group does not occur in the input, at all, so we don't need to do anything.

```

106   \ifcsdef{cc#2Cnt}
107     {\expandafter\ifnum\csname ccm#2Cnt\endcsname>\z@

```

otherwise, we call the Property that is stored in `\ccm@role@\cc@cur@cont @#2@#3` and store the result in the Component #2#3.

```

108       #1{#2}{\csname ccm@role@\cc@cur@cont @#2@#3\endcsname}{#2#3}%
109       \fi
110     }{}}

```

`\ccm@role@apply` #1 is the name of the role and #2 is the name of the composition. This macro applies (i.e. *fully expands*) the `\ccm@role@\cc@cur@cont @#1@#2` Property and stores the result in the #1#2 Component.

```
111 \def\ccm@role@apply#1#2{\ccm@eval@role\ccApplyCollection{#1}{#2}}
```

`\ccm@role@compose` #1 is the name of the role and #2 is the name of the composition. This stores the *unexpanded* contents of the `\ccm@role@\cc@cur@cont @#1@#2` Property in the #1#2 Component.

```
112 \def\ccm@role@compose#1#2{\ccm@eval@role\ccComposeCollection{#1}{#2}}
```

2 Labeled Components

`\ccDeclareLabeledComp` declares two Components: one named `\ccPrefix #2` for the value and another one named `\ccPrefix #2Label` for its corresponding label. #3 is used for property overrides. The optional Argument #1 allows to set a default value for the Label.

```
113 \def\ccDeclareLabeledComp{\cc@opt@empty\cc@declare@labeled@comp}
114 \def\cc@declare@labeled@comp[#1]#2#3{%
115   \ccDeclareComponent{#2}{\expandafter\global}{}%
116   \ccDeclareComponent{#2Label}{\expandafter\global}{}%
117   \csxdef{labeled-meta-property-infix-\cc@cur@cont-#2}{#3}%
118   \if!#1!\else
119     \long\csgdef{cc@\cc@cur@cont @#2Label}{#1}%
120   \fi
121 }
```

`\ccUseLabeledComp` declares two Components: one named `\ccPrefix#1` for the value and another one named `\ccPrefix#1Label` for its corresponding label. An optional Argument allows to set a default value for the Label.

```
122 \def\ccUseLabeledComp{\@ifstar{\global\let\ccm@no@tag\relax\cc@use@labeled@comp}{\
  cc@use@labeled@comp}}
123 \def\cc@use@labeled@comp#1{%

135 \ccaAddRolemap{MetaDatum}{Div}
136 \ccaAddRolemap{MetaDatumLabel}{Para}
137 \ccaAddRolemap{MetaDatumValue}{Para}
138 \ccaAddRolemap{Abstract}{Div}
139 \ccaAddRolemap{AbstractLabel}{P}
140 \ccaAddRolemap{AbstractText}{Div}
141 \ccaAddRolemap{Keywords}{Div}
142 \ccaAddRolemap{KeywordsLabel}{P}
143 \ccaAddRolemap{KeywordsText}{Div}

```

4 Common Meta Data

`\ccm@declare@comp` defines some commonly used meta Components

```

144 \def\ccm@declare@comp{%
145   \ccDeclareComponent{Copyright}{\expandafter\global}{}}% Copyright text
146   \ccDeclareComponent{DOI}{\expandafter\global}{}}% DOI

```

`LicenceLogo` is a component for a license logo. This usually contains an `\includegraphics`.

```

147   \ccDeclareComponent{LicenceLogo}%

```

`LicenceName` is the name of the license.

```

148   \ccDeclareComponent{LicenceName}%
149 }%

```

`article-meta` is an abstract container that holds meta data specific to journal articles.

```

150 %% for single articles
151 \ccDeclareContainer{article-meta}{%
152   \ccDeclareType{Components}{%
153     \ccDeclareGlobalComponent{StartPage} % Start page of a single article
154     \ccDeclareGlobalComponent{EndPage} % End page of a single article
155     \ccDeclareLabeledComp[Cite as]{CiteAs}{cite-as} % As what the article should be cited
156     \ccDeclareLabeledComp[Submitted]{Submitted}{submitted} % Date the article was submitted
157     \ccDeclareLabeledComp[Received]{Received}{received} % Date the article was recieved
158     \ccDeclareLabeledComp[Revised]{Revised}{revised} % Date the article was revised
159     \ccDeclareLabeledComp[Reviewed]{Reviewed}{reviewed} % Date the article was reviewed
160     \ccDeclareLabeledComp[Accepted]{Accepted}{accepted} % Date the article was accepted
161     \ccDeclareLabeledComp[Published]{Published}{published} % Date the article was published
162     \ccDeclareLabeledComp[Conflict of Interest]{COIStatement}{coi-statement}% Conflict of Interest
163   }%
164 }

```

`\ccm@extended@common@macros` provides some extended markup. Some headings use these Components for compilations of contributions by different authors. They are also loaded by article title pages.

```

165 \def\ccm@extended@common@macros{%
166   \ccDeclareLabeledComp[Abstract]{Abstract}{abstract}%
167   \ccDeclareLabeledComp[Keywords]{Keywords}{keyword}%
168   \ccDeclareLabeledComp{DOI}{doi}%

```

```

169 \ccDeclareLabeledComp{TitleEn}{title-en}%
170 \ccm@generic@comp
171 }

```

4.1 Affiliations

`\ccm@declare@affils` is a wrapper that creates the user-level macros for the affiliations.

```

172 \def\ccm@declare@affils{%
173 \ccDeclareComponent{AffilBlock}{\expandafter\global}{}%
174 \ccDeclareComponentGroup{Affil}{%
175 \ccDeclareCountedComponent{Affiliation}%

Module 6

coco-headings.dtx

```
<*headings>
```

This module provides handlers for headings like parts, chapters, sections, or inline headings common to all CoCoTeX projects.

```
23 %%
24 %% module for CoCoTeX that extends heading objects.
25 %%
26 %% Maintainer: p.schulz@le-tex.de
27 %%
28 %% lualatex - texlive >= 2019
29 %%
30 \NeedsTeXFormat{LaTeX2e}[2018/12/01]
31 \ProvidesPackage{coco-headings}
32   [2024/03/23 0.4.1 CoCoTeX headings module]
33 \RequirePackage{coco-meta}
```

Headings are handled differently with `cocotex.cls` compared to standard L^AT_EX, since cocotex manuscripts tend to have a whole collection of additional information that are pressed into the headings, like subtitles or section authors down to subsection level, etc. Therefore, the `\@startsection` and `\@make[s]chapterhead` facilities from L^AT_EX are no longer sufficient. At the same time, the package does not redefine those macros and keeps them available for backwards compatibility.

First, we load the `bookmark` package:

```
34 \RequirePackage{bookmark}%
```

Since we use our own heading levels, we disable all automatically generated bookmarks.

```
35 \hypersetup{bookmarksdepth=-999}%
```

1 Facility for declaring heading levels and their layouts

`Heading` is an abstract parent Container for headings. It inherits from `CommonMeta`.

```
36 \ccDeclareContainer{Heading}{%
37   \ccInherit{Components,Properties}{CommonMeta}%
38   \ccDeclareType{Parent}{}%
39   \ccDeclareType{Components}{%
```

We already have the `Author` Component inherited from the `CommonMeta` Container. We therefore just need to declare the overrides.

```
40   \cch@provide@authors%
```

The remaining Components are built as usual.

`Title` is the main title of the heading.

```
41 \cch@provide@comp{Title}%
```

`Subtitle` is an optional second-level title of the heading.

```
42 \cch@provide@comp{Subtitle}%
```

`Number` is the heading's counter.

```
43 \cch@provide@comp{Number}%
```

`RefLabel` is a unique ID of an heading. It is targeted by cross references and replaces L^AT_EX's `\label` command.

```
44 \ccDeclareComponent{RefLabel}{-}{-}%
```

```
45 \cch@provide@quotes
46 }%
47 \ccDeclareType{Properties}{-}%
48 \ccDeclareEnv{\cch@heading}{\cch@end@heading}%
49 }
```

`\ccDeclareHeading` is the user-level macro to declare new headings.

- #1 (optional) inherit-from: load all properties from that heading level, first.
- #2 level: used for toc entries. -1 for part, 0 for chapter, 1 for section, etc.
- #3 name: part, chapter, section, etc, to be used in toc, head lines, bookmarks, etc.
- #4 Property definitions and switches

```
50 \long\def\ccDeclareHeading{\cc@opt@empty\cc@declare@heading}

99 }%

```

Unlike other Sub-Containers, headings form no own L^AT_EX environment. Instead, headings are specifications of one common `\ccPrefix Heading` environment. Is is outsourced into the internal `\cch@declare@heading` macro, which is defined below.

The reason for that is that we don't want to define versions of the same property macros for each and every single heading level. Instead, we locally re-define the general low-level macros that represent the heading's properties for each instance of the generalised `Heading` container.

```

100 \cch@declare@heading{#2}{#3}%
101 }% \ccDeclareContainer{#3}
102 }% \ifcsdef cc@container@#3 fi

```

If CoCoT_EX's accessibility features are active, we need to register each new heading with `ltpdfa`'s autoclose mechanism.

```

103 \ccIfAlly{\cch@add@autoclose{#2}{#3}}{\AtBeginDocument\ccIfAlly

```

Finally, we check and update the counters for the lowest and highest heading levels, resp.

109 \fi
110 }% \cc@declare@heading

```

Each new heading level needs some configuration with the `ltpdfa` package in order to automatically close heading tags with the beginning of a new heading.

`\cch@add@autoclose` adds the new heading level to `ltpdfa`'s autoclose mechanism. #1 is the numeric level, #2 is the name of the heading. We do this inside the `cca/before/begin/document` hook, since we need to know *all* locally defined heading levels beforehand in order to build the Sectioning tree correctly.

```

111 \newcount\cch@tempcnta \cch@tempcnta\z@
112 \def\cch@add@autoclose#1#2{%
113   \ccAddToHook[document]{cca/at/begin/document}{%

```

First, we assign the Sectioning tag and the tag for the section's head itself to the `Sect` and `H#` tags, respectively.

```

114 \ccaAddRolemap{#2}{Sect}%

```

Then we determine the hierarchical heading level we need to assign to the PDF tags. H1 is always reserved for the entire document's title, so we need to calculate the difference of the lowest used value and 2 and add this to the actual level of the current heading.

```

115 \cch@tempcnta=\numexpr\tw@-\cch@highest@level\relax
116 \advance\cch@tempcnta by #1\relax
117 \ccaAddRolemap{#2head}{H\the\cch@tempcnta}%
118 \ifnum\cch@tempcnta>6\relax

```

```

119 \ccaAddRolemap{H\the\cch@tempcnta}{H}%
120 \fi

```

Next, we tell `ltpdfa` for each heading level which other heading level is the next down the Sectioning hierarchy. For that, we first put the current heading level in a calculable counter.

```

121 \cch@tempcnta=#1\relax

```

Then we catch the heading with the highest level (from the aux file) and set the `document` layer in the `ltpdfa`'s `Sectioning` table to have that heading as its child

```

122 \ifnum\cch@tempcnta=\cch@highest@level
123 \edef\x{\noexpand\ccaAddToConfig{autoclose}{\document={Type:Sectioning}{Child:\csname cch@#1
    @unique\endcsname}{Egroup:false}}}\x%
124 \fi

```

Then, we catch the lowest level to tell `ltpdfa`'s `Sectioning` table that this level has no children. Another switch is made to distinguish first-born heading levels from aliases, since the `Sectioning` table can only hold one heading per level. All other headings of the same level are, per definition, Aliases of the one that has been defined first.

```

247     \fi}}
248 }{}

```

2 Externalisation of Heading Components

Components of headings may be used far away from the heading itself. Since, by design, Components are defined strictly local within their containers, those external usages demand special treatment.

2.1 Common Stuff

`\cch@set@author@name@list` sets the `#1AuthorNameList` Component.

```
249 \def\cch@set@author@name@list#1{%
```

first, we look if the Override was given in the `Heading` Container. If so, we do nothing.

```
250 \ccUnlessComp{#1AuthorNameList}{%
```

If not, we look whether or not the general `AuthorNameList` override was given in the `Heading` Container.

```
251 \ifx\cc@used@AuthorNameList@override\@empty
```

If yes, then we copy its value to `#1AuthorNameList`.

```
252 \ccComponent{#1AuthorNameList}{\cc@Heading@AuthorNameList}%
253 \else
```

Or else, we re-build the `#1AuthorNameList` from the raw `Author` Subcontainers by using the `author-list-print-format` Property.

```
254 \ifnum\ccAuthorCnt>\z@
255 \ccdefFromCountedComp\cch@tempa{Author}{author-list-print-format}%
256 \ifx\cch@tempa\relax\else
257 \ccComponent{#1AuthorNameList}{\cch@tempa}%
258 \fi
259 \fi
260 \fi
261 }}%
```

2.2 Table of Contents Entry

`\cch@make@toc` initializes the creation of a `Heading` instance's entry in the table of contents.

Each entry is in itself treated as a Container. As such, it consists of Components that are written into the `.toc` file.

```
262 \def\cch@make@toc{%
263 \cc@check@empty{Heading}{Title}{Toc}%
264 \cc@check@empty{Heading}{Number}{Toc}%
265 \cc@check@empty{Heading}{Subtitle}{Toc}%
266 \cch@set@author@name@list{Toc}%
267 \ccIfAttrIsSet{Heading}{notoc}{%
268 {\protected@edef\cch@toc@entry{%
269 \ccIfComp{TocTitle}{\string\ccComponent{TocTitle}{\string\ignorespaces\space\expandonce{\cc@Heading@TocTitle}}}{}%
270 \ccIfComp{TocNumber}{\string\ccComponent{TocNumber}{\string\ignorespaces\space\expandonce{\cc@Heading@TocNumber}}}{}%
271 \ccIfComp{TocAuthorNameList}{\string\ccComponent{TocAuthorNameList}{\string\ignorespaces\space\expandonce{\cc@Heading@TocAuthorNameList}}}{}%
272 \ccIfComp{TocSubtitle}{\string\ccComponent{TocSubtitle}{\string\ignorespaces\space\expandonce{\cc@Heading@TocSubtitle}}}{}%
```

```

273 }%
274 \ccIfProp{toc-level}
275   {\edef\cch@toc@sec@name{\ccUseProperty{toc-level}}%
276   {\let\cch@toc@sec@name\ccCurSecName}%
277   \protected@write\@auxout
278   {\ccGobble}%
279   {\string\@writefile{toc}{\protect\ccContentsline{\cch@toc@sec@name}{\cch@toc@entry}{\
280     thepage}{\@currentHref}\protected@file@percent}}\relax
281   \ccCreateContentListEntries{Heading}{\cch@toc@sec@name}{\cch@toc@entry}{\thepage}{\
282     @currentHref}%
283   \ccCreateContentListEntries{\cch@toc@sec@name}{\cch@toc@sec@name}{\cch@toc@entry}{\thepage
284     }{\@currentHref}%
285 }}

```

`\cc@toc@extract@data` is called within the `\l@<level>` macro to extract the Components for each entry in the .toc file. #1 is the numerical heading level, #2 is the name of the heading level, #3 is the content of the toc entry (which holds the Components), #4 is the page number.

```

283 \def\cc@toc@extract@data#1#2#3#4{%
284   \ccSetContainer{Heading}%
285   \ccEvalType[#2]{Properties}%
286   \ccDeclareComponent{TocPage}{-}{-}%
287   \ccComponent{TocPage}{\ccUseProperty{toc-page-face}#4}%
288   \ccDeclareComponent{TocTitle}{-}{-}%
289   \ccDeclareComponent{TocSubtitle}{-}{-}%
290   \ccDeclareComponent{TocNumber}{-}{-}%
291   \ccDeclareComponent{TocAuthorNameList}{-}{-}%
292   \cc@expand@l@contents{#3}{Heading}{Toc}{Title}%
293   \cc@format@number{toc-}{Toc}{#1}%
294 }

```

`\cc@toc@print@entry` is also called within the `\l@<level>` macro and eventually prints the entry by expanding a `Heading`'s toc-specific Properties.

```

295 \def\cc@toc@print@entry#1{%
296   \bgroup
297   \ccUseHook{toc-before-hook-#1}%
298   \ccUseProperty{toc-before-entry}%
299   \ccUseProperty{toc-format}%
300   \ccUseHook{toc-after-hook-#1}%
301   \ccUseProperty{toc-after-entry}%
302   \egroup}

```

2.3 Facility to create the running title macros

`\cch@make@run` prepares the Components used to compose the running titles. It checks if the user provides page header specific overrides in the `Heading` instance. If not, it uses the non-specific Components instead, as long as they are not empty.

After all the header-specific Components are set, the heading level specific property `running-heading` is evaluated and passed to the corresponding `<level>mark` macros iff they exist.

```

303 \def\cch@make@run{%
304   \cc@check@empty{Heading}{Title}{Run}%
305   \cc@check@empty{Heading}{Number}{Run}%
306   \cc@check@empty{Heading}{Subtitle}{Run}%
307   \cch@set@author@name@list{Run}%
308   \ccUseProperty{running-extra}%

```

```

309 \ccIfProp{running-level}
310   {\letcs\cch@mark@name{\ccUseProperty{running-level}mark}}
311   {\letcs\cch@mark@name{\ccCurSecName mark}}}%
312 \letcs\cch@parent{cc@parent@ccCurSecName}%
313 \ifx\cch@mark@name\@undefined
314   \ifx\cch@parent\relax\else
315     \letcs\cch@mark@name{\cch@parent mark}%
316   \fi
317 \fi
318 \ifx\cch@mark@name\@undefined\else
319   \begingroup
320     \ccGobble
321     \protected@edef\@tempa{\csname cc@Heading@running-heading\endcsname}%
322     \expandafter\cch@mark@name\expandafter{\@tempa}%
323   \endgroup
324 \fi
325 }

```

2.4 Facility to create PDF bookmarks

`\cch@make@bookmarks` generates an entry that is directly written as Bookmark into the PDF file. This is done using the `bookmark` package.

```

326 \def\cch@make@bookmarks{%
327   \cc@check@empty[Toc]{Heading}{Title}{BM}%
328   \cc@check@empty[Toc]{Heading}{Number}{BM}%
329   \cc@check@empty[Toc]{Heading}{AuthorNameList}{BM}%
330   \cc@check@empty[Toc]{Heading}{Subtitle}{BM}%
331   \ccIfAttrIsSet{Heading}{noBM}
332   {}
333   {\ccIfProp{bookmark-level}{\edef\Hy@toclevel{\ccUseProperty{bookmark-level}}}{}%
334     \begingroup
335       \ccGobble
336       \protected@edef\@tempa{\csname cc@Heading@bookmark\endcsname}%
337       \bookmark[level=\Hy@toclevel,dest=\@currentHref]{\expandonce{\@tempa}}%
338     \endgroup
339   }}

```

3 Rendering the Headings

3.1 Inline Headings

`\cch@make@inline` Inline headings are stored in a temporary box and expanded after the next (non-heading) paragraph is opened.

```

340 \newbox\cch@inline@sec@box
341 \def\cch@make@inline{%

372     \@afterheading
373     \ignorespaces}}

```

4 The Heading environment

4.1 Environment Macros

`\cch@heading` is the macro called at the begin of the `Heading` environment. Optional #1 stores the headings local parameters, #2 is the level of the heading.

```

374 \def\cch@heading{\cc@opt@empty\cch@heading}%
375 \def\cch@heading[#1]#2{%

```

Adding start tags for the contents that “belong” to a document section. They are tagged with individual names, but all are mapped to the `<Sect>` tag.

Warning, the following code is incredibly ugly. In principle, we close the semi-group opened by `begin`, add the tagging, and then re-build the rest of the code from older and more modern L^AT_EX’s standard definitions of `begin`.

This is necessary, because otherwise we would need to either manually add the starting sectioning tag outside the `\ccPrefix Heading` environment, or, if we want to keep l^TPd_FA’s `autoclose` mechanism, the sectioning tag is auto-ended at `\end{Heading}`. Using the `env/Heading/before` hook won’t work either, because at the time of its expansion, the level of the heading isn’t known, yet. So, we need to take the ugly road, for now.

```

376 \ccIfAlly
377   {\global\let\cch@currenvir\@currenvir
378   \endgroup

```

```

379 \ccaVstructStart{#2}%

388 \fi
389 \fi}%

```

Some L^AT_EX kernel macros are saved, the namespace is set and counted groups from previous headings are reset.

```

390 \cch@reserve

```

Handling of the optional argument

```

391 \ccParseAttributes{Heading}{#1}%

```

and treatment of heading-level specific style classes.

```

392 \ccWhenAttr{Heading}{class}
393 {\global\let\cch@current@class\cc@Heading@attr@class% TODO: check if still needed!
394 \expandafter\ccUseStyleClass\expandafter{\cc@Heading@attr@class}{Heading}}%

```

`\ccCurSecName` stores the name of the current heading level.

```

395 \edef\ccCurSecName{#2}%

```

`attr-handler` is used to handle the attributes in the optional argument of `\begin{heading}`.

```

396 \cch@use@hook{attr-handler}{#2}%

```

The cascaded Properties of the heading level are expanded. This is excluded into its own macro to simplify re-definition if necessary.

```

397 \ccEvalType{#2}{Components}%
398 }

```

`\cch@end@heading` is stuff that happens at the end of the `Heading` environment.

```

399 \def\cch@end@heading{%
400 \expandafter\ifx\csname ccUseHeading\ccCurSecName\endcsname\relax
401 \PackageError{coco-headings.sty}{Heading level \ccCurSecName\space unknown!}{A Heading with

404 \fi
405 \cch@reset
406 }

```

4.2 Content Handlers

`\cch@reserve` re-directs some of L^AT_EX's kernel macros and makes sure that some other macros have their default values:

```

407 \def\cch@reserve{%
408   \ccSetContainer{Heading}%
409   \let\cch@ltx@dbl@backslash\
410   \letcs\{\ccPrefix Break}
411   \let\cc@ltx@label\label
412   \def\ccAuthorCnt{\z@}%
413   \def\ccAffilCnt{\z@}%
414   \cc@reset@components{\cc@cur@cont}%
415 }

```

`\cch@reset` restores L^AT_EX's default definitions (however, this should be unnecessary since `Heading` is an environment and therefore constitutes a closed group).

```

416 \def\cch@reset{%
417   \let\cc@cur@cont\relax
418   \let\\\cch@ltx@dbl@backslash
419   \let\label\cc@ltx@label
420   \let\ccCurSecName\relax
421 }

```

`\cch@provide@quotes` covers multiple quotation blocks associated with a heading.

```

422 \def\cch@provide@quotes{%

```

`QuoteBlockCL` is the Collection Component for one or more `Quote` Component Groups.

```

```

499 \ccSetProperty{after-heading-block}{}%

```

before-heading-block <any> is expanded at the very beginning of `@svsec`.

```

500 \ccSetProperty{before-heading-block}{\parindent\z@ \parskip\z@}%

```

toc-hook <any> is called after ToC and Bookmark entries are written and allows for material to be added to the toc file.

```

501 \ccSetProperty{toc-hook}{}% Called, after ToC and BM entries have been written to the .aux file

```

after-indent <any> if non-empty, the first paragraph after the heading will be indented.

```

502 \ccSetProperty{after-indent}{}%

```

margin-left [auto|<dimen>|<empty>] is the left margin of the heading. Its value can either be a fixed dimension, the string `auto`, or empty. If the Property is set to `auto` or an empty string, the margin is calculated from the **indent** (see below). Otherwise the fix value is used.

```

503 \ccSetProperty{margin-left}{}%

```

margin-right <skip> is the right margin of the heading block.

```

504 \ccSetProperty{margin-right}{\@flushglue}%

```

after-skip <skip> is the vertical space after the heading block. If the value is greater than or equal to 0pt, the heading is formatted in block, while it is formatted as inline heading if the value is negative.

```

505 \ccSetProperty{after-skip}{1sp}%

```

`indent` [auto|auto-global|<dimen>] is the offset of the first line of the heading relative to `margin-left`.

If the value is auto, the indent of the heading is the width of the widest `Number` Component of *all headings with the same level*.

If the value is auto-global, the indent is the width of the widest `Number` component across *all heading levels*. Both auto and auto-global require at least two L^AT_EX runs. See Sect. 3.3 in Module 3 for more details.

```
506 \ccSetProperty{indent}{auto}%
```

`number-width` <dimen> is the (actual) width of the `Number` component.

```
507 \ccSetProperty{number-width}{}%
```

`number-sep` <any> Is the separator between the `Number` and the `Title` components

```
508 \ccSetProperty{number-sep}{\space}%
```

`number-align` [left|center|right] is the horizontal alignment of the `Number` component inside its surrounding `\hbox`.

```
509 \ccSetProperty{number-align}{left}%
```

`number-format` <any> is the format of a heading's counter. It prints the `Number` component and the `number-sep` Property, and stylizes them both with the `title-face` and `number-face` Properties.

```
510 \ccSetProperty{number-format}{%
511   \bgroup
512   \ccUseProperty{title-face}%

593 }%
594 }
```

6 Miscellaneous

6.1 Alternative paragraph separation

`\ccNewPar` is a user-level macro to have a vertical skip between two local paragraphs and no indent in the second one. The amount of vertical space between the paragraphs can be adjusted with the optional argument. If #1 is omitted, `\ccnewparskip` is inserted, which defaults to `1\baselineskip` if the dimension isn't set to something other than 0pt in the preamble. This macro is intended to be used at the end of the first of the paragraphs.

```
595 \newdimen\ccnewparskip \AtBeginDocument{\ifdim\ccnewparskip=\z@\relax \ccnewparskip=1\
   baselineskip\relax\fi}
596 \def\ccNewPar{\@ifnextchar[{\cc@newpar}{\cc@newpar[\the\ccnewparskip]}}%
597 \def\cc@newpar[#1]{%

31 \ProvidesPackage{coco-notes}
32   [2024/03/23 0.4.1 le-tex coco notes module]

```

internal switch for endnotes (`\ccn@use@enttrue`) or footnotes (`\ccn@use@enfalse`, default).

```

33 \newif\ifccn@use@en \ccn@use@enfalse
34 \newif\ifccn@en@links \ccn@en@linksfalse

```

package options:

- `endnotes` activates endnotes.
- `ennotoc` prevents chapter headings in the Notes section from creating toc entries.
- `resetnotesperchapter` resets foot- and endnotes at the start of each chapter level heading. If omitted (default) foot- or endnotes are numbered throughout the whole document
- `endnotesperchapter` implies `endnotes` and allows the output of all collected endnotes at the end of each chapter. It also sets the note's heading to section level (otherwise it is chapter level).

```

35 \DeclareOption{endnotes}{\global\@ccn@use@enttrue}
36 \DeclareOption{ennotoc}{\global\let\ccn@en@no@toc\relax}
37 \DeclareOption{resetnotesperchapter}{\global\let\ccn@reset@notes@per@chapter\relax}

172   WordSpace = 1.25%
173   ]{NotoSansEthiopic-Regular.ttf}%

```

```

174 }
175 \ccDeclareBabelFont{amharic}{[%
176     BoldFont = NotoSerifEthiopic-Bold.ttf,%
177     ItalicFont = NotoSerifEthiopic-Regular.ttf,%
178     BoldItalicFont = NotoSerifEthiopic-Bold.ttf,%
179     Path = ./fonts/Noto/Ethiop/,%
180     WordSpace = 1.25
181     ]{NotoSerifEthiopic-Regular.ttf}}
182 {[BoldFont = NotoSansEthiopic-Bold.ttf,%
183     ItalicFont = NotoSansEthiopic-Regular.ttf,%
184     BoldItalicFont = NotoSansEthiopic-Bold.ttf,%
185     Path = ./fonts/Noto/Ethiop/,%
186     WordSpace = 1.25%
187     ]{NotoSansEthiopic-Regular.ttf}}%
188 }

```

3.8 Support for Syrian script

Since Babel does not support the Syrian script natively, we create a `babel-syriac.ini` file and include it, if it is needed. If we don't, the kerning and ligatures of Syriac text will be off.

Please note that due to the restrictions of the `listings`-Package, some Unicode characters cannot be displayed correctly in the documentation of the following code. Therefore, Syriac letters appear as “x” in the following source code listing.

```

189 \expandafter\ifx\csname use@script@syriac\endcsname\@empty%
190 \RequirePackage{filecontents}
191 \begin{filecontents*}{babel-syriac.ini}
192 [identification]
193 charset = utf8
194 version = 0.1
195 date = 2019-08-25
196 name.local = ??????????
197 name.english = Classical Syriac
198 name.babel = classicalsyriac
199 tag.bcp47 = syc
200 tag.opentype = SYR
201 script.name = Syriac
202 script.tag.bcp47 = Syrc
203 script.tag.opentype = syrc
204 level = 1
205 encodings =
206 derivate = no
207 [captions]
208 [date.gregorian]
209 [date.islamic]
210 [time.gregorian]
211 [typography]
212 [characters]
213 [numbers]
214 [counters]
215 \end{filecontents*}
216 \fi

```

Now, we can create the fallback font and import the newly created ini file:

```

217 \ccDeclareBabelFont[import=syriac]{syriac}{[%
218     BoldFont = NotoSansSyriac-Black.ttf,%
219     ItalicFont = NotoSansSyriac-Regular.ttf,%

```

```

220     BoldItalicFont = NotoSansSyriac-Black.ttf,%
221     Path = ./fonts/Noto/Syriac/,%
222     WordSpace = 1.25
223   ]{NotoSansSyriac-Regular.ttf}}
224 {[BoldFont = NotoSansSyriac-Black.ttf,%
225   ItalicFont = NotoSansSyriac-Regular.ttf,%
226   BoldItalicFont = NotoSansSyriac-Black.ttf,%
227   Path = ./fonts/Noto/Syriac/,%
228   WordSpace = 1.25%
229   ]{NotoSansSyriac-Regular.ttf}%
230 }

```

3.9 Support for medieval scripts and special characters

only `rm!`

```

231 \babelfont{mdv}[%
232 Path=fonts/Junicode/,%
233 ItalicFont = Junicode-Italic.ttf,%
234 BoldFont = Junicode-Bold.ttf,%
235 BoldItalicFont = Junicode-BoldItalic.ttf,%
236 ]{Junicode.ttf}
237 \def\mdvfont#1{{\mdvfamily#1}}

```

```
</script>
```

Module 9

coco-title.dtx

```
<*title>
```

This file provides macros and facilities for title pages.

31 \ProvidesPackage{coco-title}
32   [2024/03/23 0.4.1 CoCoTeX title module]
33 \RequirePackage{coco-meta}

```

1 Top-Level Interface

`titlepage` is the main Container for the whole document's meta data.

```

34 \ccDeclareContainer{titlepage}{%
35   \ccInherit {Components,Properties}{CommonMeta}%
36   \ifarticle\ccInherit{Components}{article-meta}\fi
37   \ccDeclareType{Components}{%
38     \cct@simple@comps

```

The following macro provides some meta data Components defined in the `coco-meta` module. They are:

- `Abstract` and `AbstractTitle`,
- `Keywords` and `KeywordsTitle`,
- `DOI` and `DOITitle`, and
- `TitleEn` and `TitleEnTitle`, intended for foreign language publications where the title is translated into English.

```

39   \cct@fundings@comp
40   \cct@role@handlers{author}{Author}%
41   \cct@declare@role{editor}{Editor}%
42   \cct@declare@role{series-editor}{SeriesEditor}%
43 }%
44 \ccDeclareType{Properties}{}%
45 \ccDeclareEnv[Meta]{\cctmeta}{\endcctmeta}%
46 }

```

`\cct@declare@role` declares the roles for editors and series editors and initializes the biography meta block for both.

```

47 \def\cct@declare@role#1#2{%
48   \ccDeclareRole[#1]{#2}%
49   \cct@role@handlers{#1}{#2}%
50 }

```

`\cct@role@handlers` adds title page specific Components and Handlers to the Author, Editor and Series-Editor Roles.

```

51 \def\cct@role@handlers#1#2{%
52   \ccAddToRole{#2}{%
53     \ccDeclareCountedComponent{Bio}%
54     \ccDeclareCountedComponent{Biography}%
55   \ccDeclareGroupHandler{#2}{%
56     \ccIfComp{Biography}{\ccIfComp{Bio}{\ccComponent{Biography}{\ccUseProperty{#1-biography-
57       format}}}}}%
58   }%
59   \ccDeclareRoleBlock[apply]{#2}{BioBlock}{#1-bio-block-format}%
60 }

```

`\ccDeclareTitlepage` is the default titlepage declarator with the next token being added the titlepage's Property list.

```

60 \def\ccDeclareTitlepage{\ccAddToType{Properties}{titlepage}}

```

`\cctmeta` is the code executed at the beginning of the `\ccPrefix Meta` Container

```

61 \def\cctmeta{\cc@opt@empty\cct@meta}
62 \def\cct@meta[#1]{%
63   \ccParseAttributes{Meta}{#1}%
64   \ccUseHook[Meta]{attr-handler}%
65   \ccEvalType{Components}%
66 }

```

`\ccAddTitleRole` is a user-level macro to add both a new Role with the name #2 and a controlling Property #1 to the `titlepage` container.

```

67 \def\ccAddTitleRole#1#2{%
68   \ccAddToType{Components}{titlepage}{\cct@declare@role{#1}{#2}}%
69   \ccAddTitleEval{\cct@eds@eval{#2}}%
70 }

```

`\ccAddTitleEval` is a User-level macro to add additional Material titlepage evaluators (the next token).

```

71 \def\ccAddTitleEval{\csgappto{\cct@add@eval}}

```

`\cct@add@eval` is a hook for additional titlepage evaluators

```

72 \def\cct@add@eval{}

```

`\endcctmeta` is the code executed at the end of the `Meta` Container

```

73 \def\endcctmeta{%
74   \ccSetContainer{titlepage}%
75   \ccEvalType{Properties}%
76   \cct@maketitle
77   \ccm@role@eval{Author}%

```

```

78 \ccApplyCollection{Affil}{affil-block-item-format}{AffilBlock}%
79 \cct@eds@eval{Editor}%
80 \cct@eds@eval{SeriesEditor}%
81 \ccm@generic@eval
82 \cct@fundings@eval
83 \cct@add@eval
84 \cc@if@preamble\cct@set@pdfmeta\relax

```

Now, we expand the document-meta-hook.

```

85 \ccUseHook{document-meta-hook}%
86 \let\cct@cur@cont\@empty
87 }

```

2 Processing of PDF Meta Data

The next few macros handle the content that is written directly into the pdf as meta data.

`\cct@set@pdfmeta` is the wrapper for the whole meta data handling.

```

88 \def\cct@set@pdfmeta{%

```

`\cct@write@pdf@meta` is used to transfer the DocumentInfo meta data to the pdf writer.

```

89 \def\cct@write@pdf@meta##1##2##3{%
90 \let\cct@cur@data\@empty

```

First, we check, whether `coco-accessibility.sty` is used. If so, we check if the User has provided an `xmp` file by reading the required meta data field given in `##2` from that `xmp` file. If there is an `xmp` file and the data field is non-empty, we do nothing, because in this case, the PDF DocInfo is auto-generated from the data in the `xmp` file by the `ltpdfa` package.

```

91 \ccIfAlly{\edef\cct@cur@data{\expandonce{\directlua{tex.print(cocotex.ally.meta.##2)}}}}{%
92 \ifx\cct@cur@data\@empty

```

If the temporary storage `\cct@cur@data` is still empty, we take the value given in `\#\#3` and store its plain text in `\cct@cur@data`. Data conversion is done with `hyperref`'s `\pdfstringdef` macro.

```

93 \pdfstringdef\cct@cur@data{##3}%

```

If the storage is still empty (i.e. the field is also missing in the `Meta` environment), we do nothing.

```

94 \ifx\cct@cur@data\@empty\else

```

If the user has provided the data Component in the `Meta` environment, we pass it either to `hyperref`'s `hypersetup` variable given in `\#\#1` (when `coco-accessibility.sty` is *not* used), or we pass it to `ltpdfa.setDocInfo` using the data field given in `\#\#2`. In this case, the `ltpdfa` automatically creates a `\jobname.xmp` from which the DocInfo will be generated during subsequent `LATEX` run(s).

```

95 \ccIfAlly

```

If we use `coco-accessibility`, we invoke `\ccaSetDocinfo{\#\#2}{\#\#3}`,

```

96 {\edef\x{\noexpand\ccaSetDocinfo{##2}}%
97 \expandafter\x\expandafter{\cct@cur@data}}%

```

or `hyperref`'s `\hypersetup{##1=##3}`, if not. Note that we need to feed `##3` directly into `hypersetup` since it passes the values of pdf meta data keys through `pdfstringdef`. If we were to pass `\cct@cur@data`, which already went through `pdfstringdef`, the octal byte sequences from the first run are interpreted a second time, which leads to weird glyphs in the final PDF's DocInfo. Therefore, we stick with the original input.

```

98     {\protected@edef\x{\noexpand\hypersetup{##1={\expandonce{##3}}}\x}%
99     \fi
100    \fi
101   }%

```

After we decided how we want to process the PDF meta data, we now start to collect the necessary data points:

```

102  \cct@title@insert@xmp
103  \cct@title@process@bkc
104  \cct@title@process@bkt
105  \cct@title@process@bka
106 }

```

2.1 Processing of the Document's Title

`\cct@title@process@bkt` processes the document's main title

```

107 \def\cct@title@process@bkt{%
108   \cslet{\ccPrefix Break}\space
109   \pdfstringdef\@title{\ccUseComp{Title}}%
110   \cct@write@pdf@meta{pdftitle}{Title}{\ccUseComp{Title}}%
111   \ccpgdefFromProperty{RunBookTitle}{run-book-title}%
112 }

```

2.2 Processing of the Document's Author

`\cct@title@process@bka` processes the document's main author or, if that doesn't exist, the main editor, or throws a warning if neither exist.

```

113 \def\cct@title@process@bka{%
114   \@tempswatrue
115   \begingroup
116   \ccGobble
117   \renewcommand\foreignlanguage[2]{##2}%
118   \ccIfComp{AuthorPDFInfo}
119   {\ccpgdefFromProperty{RunBookName}{AuthorPDFInfo}}
120   {\ccIfComp{EditorPDFInfo}
121   {\ccpgdefFromProperty{RunBookName}{EditorPDFInfo}}
122   {\ifnum\ccAuthorCnt>\z@
123     \@setpar{\@par}%
124     \ccgdefFromCountedComp{RunBookName}{Author}{author-list-pdfinfo-format}%
125   \else
126     \ifnum\ccEditorCnt>\z@
127       \ccpgdefFromCountedComp{RunBookName}{Editor}{editor-list-pdfinfo-format}%
128     \else
129       \ccPackageWarning{transcript-title}{Meta Data}{No author or editor given!}%
130     \@tempswafalse
131   \fi
132   \fi}%
133 \if@tempswa
134   \pdfstringdef\@author{\csname\ccPrefix RunBookName\endcsname}%
135   \cct@write@pdf@meta{pdfauthor}{Author}{\csname\ccPrefix RunBookName\endcsname}%

```

```

136 \fi
137 \endgroup
138 }

```

2.3 Processing of the PDF's Creator, Producer, and Keywords Meta Data

`\cct@title@process@bkc` processes the metadata for the pdf creator

```

139 \def\cct@title@process@bkc{%
140 \cct@write@pdf@meta{pdfcreator}{Creator}{\ccIfComp{PDFCreator}{\ccUseComp{PDFCreator}}{\
    ccUseComp{Publisher}\ccIfComp{PubPlace}{, \ccUseComp{PubPlace}}{}}}%
141 \cct@write@pdf@meta{pdfproducer}{Producer}{\ccUseComp{PDFProducer}}}%
142 \cct@write@pdf@meta{pdfkeywords}{Keywords}{\ccUseComp{Keywords}}}%
143 }

```

2.4 Including the XMP Meta Data

`\cct@title@insert@xmp` inserts the contents of the XMP meta data file into the pdf, if it exists. There are two versions, depending on whether coco-accessibility is active or not.

```

144 \def\cct@title@insert@xmp{\ccIfAlly{\cct@title@insert@xmp@ltpdfa}{\cct@title@insert@xmp@direct}}

```

`\cct@title@insert@xmp@direct` is the default version which writes the xmp meta data directly into the PDF.

```

145 \def\cct@title@insert@xmp@direct{%
146 \edef\include@xmp{\noexpand\include@xmp{\ccUseComp{XmpFile}.xmp}}}%
147 \def\@include@xmp##1{\IfFileExists{##1}{\@include@xmp{##1}}{}}%
148 \def\@include@xmp##1{%
149 \begingroup
150 \immediate\pdfobj stream attr {/Type /Metadata /Subtype /XML}
151 file{##1}
152 \pdfcatalog{/Metadata \the\pdflastobj\space 0 R}
153 \endgroup}%
154 \include@xmp
155 }

```

`\cct@title@insert@xmp@ltpdfa` is the version that uses ltpdfa's mechanism to write XMP meta data into the PDF.

First we check if the specified xmp file exists. If it exists, the `DocumentInfo` is extracted from the XMP file. Otherwise, we set the `DocumentInfo` from the contents of the `titlepage` Container and let `ltpdfa` generate the `xmp` file.

```

156 \def\cct@title@insert@xmp@ltpdfa{%
157 \edef\cca@xmp@file@name{\ccUseComponentFrom{titlepage}{XmpFile}.xmp}%
158 \IfFileExists{\cca@xmp@file@name}
159 {\ccaAddToConfig{metadata}{xmpfile=\cca@xmp@file@name}%
160 \directlua{ally.meta.extract()}}
161 {\ccPackageWarning{A11y}{File}}}%
162 \cca@xmp@file@name\space not found.^^J
163 Note that the ltpdfa package will create one^^J
164 from the Components given in the Meta Container.}}

```

3 Intermediate Level Interfaces

`before-maketitle-hook` is expanded right before the titlepage is printed.

```
165 \ccDeclareHook[titlepage]{before-maketitle-hook}
```

`document-meta-hook` is expanded at the very end of the Meta Container.

```
166 \ccDeclareHook[titlepage]{document-meta-hook}
```

`attr-handler` is used to handle the attributes in the optional argument of `\begin{\ccPrefix Meta}`.

```
167 \ccDeclareHook[titlepage]{attr-handler}
```

`\cct@article@titlepage` is the prototype for article title pages.

```
168 \def\cct@article@titlepage{%
169   \ccUseProperty{article-title}%
170 }
```

`\cct@journal@titlepage` is the prototype for journal title pages.

```
171 \def\cct@journal@titlepage{%
172   \ccUseProperty{before-titlepage}%
173   \ccUseProperty{coverpage}%Cover ist kein Bild, wird von uns gebaut
174   \ccUseProperty{before-titlepage-roman}%
175   \ccUseProperty{titlepage-roman}%
176   \ccUseProperty{after-titlepage}%
177 }
```

`\cct@book@titlepage` is the prototype for book (monographs and collections) title pages.

```
178 \def\cct@book@titlepage{%
179   \ccUseProperty{before-titlepage}%
180   \ccWhenComp{Cover}{\ccUseProperty{coverpage}}%
181   \ccUseProperty{before-titlepage-roman}%
182   \ccUseProperty{titlepage-roman}%
183   \ccUseProperty{after-titlepage}%
184 }
```

`\cct@maketitle` assigns one of the above definitions to the `\ccPrefix Maketitle` macro.

```
185 \def\cct@maketitle{%
186   \expandafter\gdef\csname\ccPrefix Maketitle\endcsname{%
187     \let\cc@cnt@grp\@empty
```

Here, we expand the before-maketitle-hook.

```
188   \ccUseHook[titlepage]{before-maketitle-hook}%
189   \bgroup
190   \ccSetContainer{titlepage}%
191   \ccEvalType{Properties}%
192   \ifarticle
193     \cct@article@titlepage
194   \else
195     \ifjournal
```

```

196     \cct@journal@titlepage
197   \else
198     \cct@book@titlepage
199   \fi
200 \fi
201 \egroup
202 \ccUseHook[titlepage]{after-maketitle-hook}%
203 }%
204 }

```

3.1 Funds, Grants, and Supporters

This is a Subcontainer within `\ccPrefix Meta` which allows to set up multiple funding, grant, or supporter callouts.

`\cct@fundings@comp` wrapper to set up the Subcontainer

```

205 \def\cct@fundings@comp{%
206   \ccDeclareComponent{FundingBlock}{\expandafter\global}{}%
207   \ccDeclareComponentGroup{Funding}{%
208     \ccDeclareCountedComponent{FundName}%
209     \ccDeclareCountedComponent{FundLogo}%
210     \ccDeclareCountedComponent{FundID}%
211   }{}%
212 }

```

`\cct@fundings@eval` Evaluator for the funding

```

213 \def\cct@fundings@eval{%
214   \def\cc@cur@cont{titlepage}%
215   \ccComposeCollection{Funding}{fund-format}{FundingBlock}%
216 }

```

`\cct@eds@eval` evaluator for the editors

```

217 \def\cct@eds@eval#1{%
218   \ccm@role@eval{#1}%
219   \cct@create@editor@string{#1}}

```

`\cct@create@editor@string` evaluates the editor string and adds a suffix.

```

220 \def\cct@create@editor@string#1{%
221   \expandafter\ifx\csname cc@\cc@cur@cont @#1NameList\endcsname\relax\else
222     \csgappto{cc@\cc@cur@cont @#1NameList}{\letcs\ccTotalCount{cc#1Cnt}\ccUseProperty{editor-
223       suffix}}}%
224 \fi
225 }%

```

3.2 Simple Component Declarations

`\cct@simple@comps` wrapper for the Titlepage's simple Components.

```

225 \def\cct@simple@comps{%
226   \ccDeclareGlobalComponent[\jobname]{XmpFile} % File basename of the XMP file ('.xmp' is added
227     automatically)
228   %% Cover

5 Accessibility Features

5.1 Output Intent and ICC Profiles

```

608 \ccWhenAlly{%

```

First, we declare some Components that represent the three necessary parameters for the output intent:

```
609 \ccAddToType{Components}{titlepage}{%
```

`IccProfileFile` holds the path (relative to the main tex file) and name of the .icc file.

```
610 \ccDeclareGlobalComponent{IccProfileFile}
```

`IccComponents` holds the number of components in the color profile

```
611 \ccDeclareGlobalComponent{IccComponents}
```

`IccIdentifier` holds the identifier of the color profile

```
612 \ccDeclareGlobalComponent{IccIdentifier}}
```

The Components are composed via a new Property `output-intent` which we add to `coco-title`'s Properties list (`\cc@color@enc` is set via the `coco-common` module):

```
613 \ifdefstring\cc@color@enc{cmyk}
614   {\def\cca@default@icc@comp{4}}
615   {\def\cca@default@icc@comp{3}}
616 \ifdefstring\cc@color@enc{cmyk}
617   {\def\cca@default@icc@iden{Coated FOGRA39}}
618   {\def\cca@default@icc@iden{sRGB IEC61966-2.1}}
619 \ccAddToType{Properties}{titlepage}{%
```

`output-intent` <see below> sends the output intent information to the `ltpdfa` package. It must contain of three data fields:

`profile` with the name of the to-be-embedded .icc file,

`componetns` with an integer telling the pdfwriter how many values are coded by each color (e.g., 4 for cmyk, 3 for rgb)

`identifier` with the identifying name of the profile (e.g., `Coated FOGRA39` for the included cmyk profile, etc.)

```
620 \ccSetProperty{output-intent}{%
621   profile=\ccIfComp{IccProfileFile}{\ccUseComp{IccProfileFile}}{suppl/\cc@color@enc.icc};%
622   components=\ccIfComp{IccComponents}{\ccUseComp{IccComponents}}{\cca@default@icc@comp};%
623   identifier=\ccIfComp{IccIdentifier}{\ccUseComp{IccIdentifier}}{\cca@default@icc@iden}%
624 }
```

The Component Handler which links the new Components to that Property is added to `titlepage`'s `document-meta-hook`:

```
625 \ccAddToHook[titlepage]{document-meta-hook}{\edef\x{\noexpand\ccaAddToConfig{intent}{\ccUseProperty{output-intent}}}\x}
```

5.2 Encoding of the PDF-A Conformance

As before, the parameters for the PDF conformity level are encoded via specific Components in the `titlepage` Container:

```
626 \ccAddToType{Components}{titlepage}{%
```

`PDFAID` defines the PDF/A ID (Default: 2, meaning: PDF/A-2)

```
627 \ccDeclareGlobalComponent[2]{PDFAID}%
```

`PDFALevel` defines the PDF/A Level (Default: A, meaning PDF/A-2A)

```
628 \ccDeclareGlobalComponent[A]{PDFALevel}%
```

PDFUAID defines the PDF standard (Default: 1, meaning: PDF/UA-1). Use `\ccPrefix PDFUAID{}` (i.e. set it to nothing) to make the document conform to the PDF/A standard, but **not** to the PDF/UA standard.

```
629 \ccDeclareGlobalComponent[1]{PDFUAID}%
```

The checking if the values are valid, and the separation of the various parts of the standard is done via a lua script in the `document-meta-hook`. The **conformance** DocumentInfo nodes are only written, if *neither* **PDFALevel**, *nor* **PDFUAID** is empty.

```
630 \ccAddToHook[toplevel]{document-meta-hook}{%
631   \ccIfCompEmpty{PDFUAID}{\ccIfCompEmpty{PDFALevel}}{%
632     \edef\x{\noexpand\ccaSetDocinfo{conformance}}{%
633       pdfaid=\ccUseComp{PDFUAID};%
634       level=\ccUseComp{PDFALevel}%
635       \ccIfCompEmpty{PDFUAID}{\ccIfCompEmpty{PDFALevel}}{%
636         \x}}}
```

5.3 Titlepage Specific Role Maps

According to the “Tagged PDF Best Practice Guide” page by the PDF Association, the main title of the document should be mapped to **<P>** until the more appropriate **<Title>** tag becomes widely accepted with the PDF 2.0 Standard.

```
637 \ccaAddRolemap{Title}{H1}
638 \ccaAddRolemap{Titlepage}{Div}
```

```
639 }%ccWhenAlly
```

```
</title>
```

Module 10

coco-floats.dtx

Output driver for `coco-floats.sty`.

```
<floats>
```

This module provides handlers for floating objects like tables and figures common to all CoCoTeX projects

Note that we take the term “Float” quite liberally: “Floats” basically mean “*things that may have a caption and which are somewhat outside the main text body*”, whether they actually float (i. e., moved into the `\@toplist` or `\@botlist` by L^AT_EX), or not.

```
23 %%
24 %% module for CoCoTeX that extends floating objects.
25 %%
26 %% Maintainer: p.schulz@le-tex.de
27 %%
28 %% lualatex - texlive > 2019
29 %%
30 \NeedsTeXFormat{LaTeX2e}[2018/12/01]
31 \ProvidesPackage{coco-floats}
32   [2024/03/23 0.4.1 CoCoTeX floats module]
33 \DeclareOptionX{nofigs}{\global\let\ccf@no@figs\relax}
34 \ProcessOptionsX
```

1 Package Setup

1.1 Hard requirements

For the list-of mechanism, we need the CoCoTeX common module, which also loads the CoCoTeX kernel module.

```
35 \RequirePackage{coco-common}
```

For landscape images, we load the `rotating` package.

```
36 \RequirePackage{rotating}
```

Since file names from word often contain spaces and periods, we also include the `grffile` package.

```
37 \RequirePackage{grffile}
```

In order to save footnotes in captions, we require the `footnote` package.

```
38 \RequirePackage{footnote}
```

The `adjustbox` package is needed to restrict the maximum dimensions of image files.

```
39 \RequirePackage[Export]{adjustbox}
```

Finally, we need the `stfloats` package to allow bottom placed images on pages that start L^AT_EX's twocolumn mode.

```
40 \usepackage{stfloats}
41 \setcounter{dblbotnumber}{5}
```

1.2 Adjustments at the Beginning of the Document

```
42 \AtBeginDocument{%
```

The first adjustment implements the `nofigs` option by deactivating the `\includegraphics` macro.

```
43 \ifx\ccf@no@figs\relax
44 \renewcommand\includegraphics[2] [] {}%
45 \fi
```

`\ccf@ltx@includegraphics` stores the final definition of the `\includegraphics` macro for later use.

```
46 \global\let\ccf@ltx@includegraphics\includegraphics
```

Adjustments to the `htmltabs` package, if it is used:

```
47 \@ifpackageloaded{htmltabs}
48 {\global\let\cc@uses@htmltabs\relax
49 \def\ht@adjust@linewidth{%
50 \advance\ht@h@offset\leftskip
51 \advance\ht@h@offset\@totalleftmargin
52 \advance\linewidth-\rightskip
53 }%
54 }{}%
```

In order to catch the actual dimensions of the float box, we need to hook into L^AT_EX's `\@endfloatbox` macro. This macro is low-level enough so it covers regular, double-column, and rotated floats. Those values will later be written into the `.aux` file for each float. The values, together with the float's overall width, are stored in a macro called `cc-float-\the\ccf@int@cnt-dimens`.

```
55 \gappto\@endfloatbox{%
56 \global\ccf@total@height=\ht\@currbox\relax%
57 \global\ccf@total@depth=\dp\@currbox\relax%
58 }%
59 }%
```

1.3 Document Class-Option Overrides

Since CoCoTeX is mainly developed for automatic typesetting and float positioning, we set rather high tolerances for macros from L^AT_EX's standard `.clo` files:

```
60 \def\topfraction{0.9}
61 \def\textfraction{0.1}
62 \def\bottomfraction{0.8}
63 \def\totalnumber{8}
64 \def\topnumber{8}
65 \def\bottomnumber{8}
66 \def\floatpagefraction{0.8}
67 \@fptop\z@
68 \@fpbot\@flushglue
```

1.4 Internal Registers

`\ccf@floatbox` is for measuring the dimensions of the whole float

```
69 \newbox \ccf@floatbox
```

`\ccf@sub@box` is for measuring a single sub-float.

```
70 \newbox \ccf@sub@box
```

`\ccf@int@cnt` is an internal global counter that numbers all top-level floats sequentially.

```
71 \newcount\ccf@int@cnt \ccf@int@cnt\z@
```

`\ccSubFloatCnt` counts the sub-floats within a parent float Container instance.

```
72 \newcount\ccSubFloatCnt \ccSubFloatCnt=\z@\relax
```

`\ccf@int@sub@flt@cnt` is a temporary counter that holds the total number of subfloats inside a parent float Container instance.

```
73 \newcount\ccf@int@sub@flt@cnt \ccf@int@sub@flt@cnt\z@
```

Various dimension registers that store dimensions and spaces of floats and sub-floats:

`\ccf@sub@maxheight` stores and self-updates the height of the largest sub-float inside a float

```
74 \newdimen\ccf@sub@maxheight \ccf@sub@maxheight=\z@\relax
```

`\ccf@sub@sep` is the space between sub-floats

```
75 \newdimen\ccf@sub@sep \ccf@sub@sep=\fboxsep\relax
```

`\ccf@total@width` stores the cumulated overall width of the entire float

```
76 \newdimen\ccf@total@width \ccf@total@width=\textwidth\relax
```

`\ccf@calc@width` is an internal dimension used to calculate the ratio between mutiple sub-floats that should be scaled to the same height

```
77 \newdimen\ccf@total@height \ccf@total@height=\textwidth\relax
```

`\ccf@total@height` is the overall height of a float

```
78 \newdimen\ccf@total@depth \ccf@total@depth=\textwidth\relax
```

`\ccf@total@depth` is the overall depth of a float

```
79 \newdimen\ccf@calc@width \ccf@calc@width=\ccf@total@width\relax
```

`\ccf@sep@top` holds the actual vertical skip inserted at the top of a float. If the float is floating, this equals to `intext-skip`, or `float-skip`, otherwise.

```
80 \newskip\ccf@sep@top \ccf@sep@top=\z@\relax
```

`\ccf@sep@bottom` is the same for the bottom vertical skip.

```
81 \newskip\ccf@sep@bottom \ccf@sep@bottom=\z@\relax
```

Internal dimensions for the horizontal margins:

`\ccf@margin@r` holds the right side margin

```
82 \newdimen\ccf@margin@r \ccf@margin@r=\z@\relax
```

`\ccf@margin@l` holds the left side margin

```
83 \newdimen\ccf@margin@l \ccf@margin@l=\z@\relax
```

`\ccf@margin@i` holds the inner margin

```
84 \newdimen\ccf@margin@i \ccf@margin@i=\z@\relax
```

`\ccf@margin@o` holds the outer margin

```
85 \newdimen\ccf@margin@o \ccf@margin@o=\z@\relax
```

`\ifccf@break@capt` is a locally adjustable switch that indicates whether captions are allowed to break across pages (true) or not (false).

```
86 \newif\ifccf@break@capt \ccf@break@captfalse
```

2 Internal macros

2.1 Generic resetter

Some macros are re-evaluated for each new top-level float.

`\ccf@reset@defaults` resets the those macros. It is called at the very beginning of each new float.

```
87 \def\ccf@reset@defaults{%
88   \global\ccSubFloatCnt=\z@
89   \global\ccf@total@width=\z@
90   \global\let\ccf@has@capt@top\@undefined
91   \global\let\ccf@has@capt@bottom\@undefined
92   \global\let\ccf@has@subcapt@top\@undefined
93   \global\let\ccf@has@subcapt@bottom\@undefined
94   \global\let\ccf@sub@contentsline@store\@empty
95   \global\ccf@sub@maxheight=\z@\relax
96   \@tempcnta=\z@\relax
97   \cc@reset@components{\cc@cur@cont}%
98   \let\ccf@prefix\@empty
99   \let\ht@cur@element\ccfCapType
100  \global\let\ccf@current@class\relax
101 }
```

2.2 Wrapper for L^AT_EX's Native float Environments

`\ccf@set@env` determines the low-level L^AT_EX float environment depending on orientation and document options. If no `float-pos` is given (implicitly or determined), the object is not treated as a float at all.

```

102 \def\ccf@set@env{%
103   \ifx\ccf@floatpos\empty
104     \let\ccf@begin@env\bgroup

128 \def\ccf@set@bot@sep{\addvspace{\ccf@sep@bottom}}

```

3 The Generic float Container

Components in Containers that are derived from the abstract `float` are in fact all Counted Components, where top-level instances use 0 as their internal counter and sub-floats are counted incrementally. Thus, we can *simplify* the **internal** names to `<Componentname>-<Counter>`, which is done via a custom wrapper for the `\cc@def@counted@comp` Component declarator.

`\ccfMakeComp` is a shortcut for float Component declarations.

`{#1}` is the generic name of the Component.

```

129 \def\ccfMakeComp#1{%
130   \cc@def@counted@comp{#1-\the\ccSubFloatCnt}{#1}{\fi}%
131 }

```

`\ccfMakeCompL` is a shortcut to declare Float Components together with their *list-of* overrides.

`{#1}` is the generic name of the Component.

```
132 \def\ccfMakeCompL#1{%
133   \ccfMakeComp{#1}%
134   \ccfMakeComp{Listof#1}}
```

`float` is the main parent Container for all floats.

```
135 \ccDeclareContainer{float}{%
```

3.1 Common Float Components

```
136   \ccDeclareType{Components}{%
```

First, we set the naming scheme of the internal Component macros which is then valid for all Component declarations by locally re-defining `\cc@counted@comp@scheme`.

```
137   \def\cc@counted@comp@scheme##1{##1-\the\ccSubFloatCnt}%
```

`Content` is the main content holder of a float.

```
138   \ccfMakeComp{Content}%
```

`Caption` is the main caption of a float.

`ListofCaptionOR` is the corresponding list-of-entry

```
139   \ccfMakeCompL{Caption}%
```

`Legend` is a legend to a float.

`ListofLegendOR` is the corresponding list-of-entry

```
140   \ccfMakeCompL{Legend}%
```

`Source` is the source of a float.

`ListofSourceOR` is the corresponding list-of-entry

```
141   \ccfMakeCompL{Source}%
```

`Number` is the counter of the float (including the label)

`ListofNumberOR` is the corresponding list-of-entry

```
142   \ccfMakeCompL{Number}%
```

`RefLabel` is the float's ID used for cross-references (replaces L^AT_EX's `\label` command)

```
143   \ccfMakeComp{RefLabel}%
```

ListofEntryCL is the Collection Component for the entire Listof entry.

```
144 \ccfMakeComp{ListofEntry}%
145 }%
```

3.2 Common Float Properties

```
146 \ccDeclareType{Properties}{%
```

Placement and Spacing

intext-skip-top <skip> vertical space between the text body and following non-floating floats

```
147 \ccSetProperty{intext-skip-top}{\intextsep}%
```

intext-skip-bottom <skip> vertical space between non-floating floats and the following text body

```
148 \ccSetProperty{intext-skip-bottom}{\intextsep}%
```

float-skip-top <skip> vertical space between text body and following floating floats

```
149 \ccSetProperty{float-skip-top}{\z@}%
```

float-skip-bottom <skip> vertical space between floating floats and following text body

```
150 \ccSetProperty{float-skip-bottom}{\z@}%
```

sub-float-sep <skip> horizontal space between sub-floats

```
151 \ccSetProperty{sub-float-sep}{\ccf@sub@sep}%
```

margin-inner <skip> inner margins of floats in twopage mode, i. e., left margin on odd pages and right margin on even pages, respectively.

```
152 \ccSetProperty{margin-inner}{\z@}%
```

margin-outer <skip> outer margin of floats in twopage mode, i. e., right margin on odd pages and left margin on even pages, respectively.

```
153 \ccSetProperty{margin-outer}{\z@}%
```

margin-left <skip> horizontal space between the left page area boundary and the float.

```
154 \ccSetProperty{margin-left}{\z@}%
```

margin-right <skip> horizontal space between the right page area boundary and the float.

```
155 \ccSetProperty{margin-right}{\z@}%
```

before-float <any> is the code that is executed before a float's content is evaluated.

```
156 \ccSetProperty{before-float}{\parindent\z@}%
```

Properties for Float-Type Handlers

subfloat-content <any> is the material that is put into the `\ccf@sub@box` for further processing.

```
157 \ccSetProperty{subfloat-content}{\ccUseComp{Content}}%
```

float-render <any> the output routine for top-level float type specific contents

```
158 \ccSetProperty{float-render}{\ccUseComp{Content}}%
```

subfloat-render <any> the output routine for second-level float type specific contents.

```

304 {\the\ccf@total@height}%
305 {\the\ccf@total@depth}%
306 }}%

```

3.4 The SubFloat Environment

The SubFloat Sub-Container

Second-level floats (or SubFloats) are sub-containers of the float container.

`\ccSubFloat` is the user-level environment for sub-floats

```

307 \def\ccSubFloat{%
308   \ifx\ccf@is@subfloat\relax
309     \PackageError{coco-floats.sty}{Nested ccSubFloats detected!}{You cannot (yet) nest a `
      ccSubFloat' environment into another `ccSubFloat' environment!}%
310   \else
311     \global\let\ccf@is@subfloat\relax
312     \global\advance\ccSubFloatCnt\@ne
313   \fi
314   \global\cslet\ccf@made@label@for@\the\ccSubFloatCnt\relax
315   \ignorespaces}

```

`\endccSubFloat` is the end of the sub-float environment

```

316 \def\endccSubFloat{%
317   \setbox\ccf@sub@box\hbox{\ccGobble
318     \ccUseProperty{subfloat-content}}%
319   }%
320   \expandafter\xdef\csname ccf@\cc@cur@cont @width-\the\ccSubFloatCnt\endcsname{\the\wd\
      ccf@sub@box}%
321   \expandafter\xdef\csname ccf@\cc@cur@cont @height-\the\ccSubFloatCnt\endcsname{\the\ht\
      ccf@sub@box}%
322   \expandafter\xdef\csname ccf@\cc@cur@cont @depth-\the\ccSubFloatCnt\endcsname{\the\dp\
      ccf@sub@box}%
323   \@tempdima=\dimexpr\the\ht\ccf@sub@box+\the\dp\ccf@sub@box\relax
324   \@tempdimb=\dimexpr\the\wd\ccf@sub@box\relax
325   \ifdim\@tempdima>\ccf@sub@maxheight\relax
326     \global\ccf@sub@maxheight=\@tempdima\relax
327   \fi
328   \global\setbox\ccf@sub@box\box\voidb@x
329   \global\let\ccf@is@subfloat\undefined
330   \aftergroup\ignorespaces
331 }

```

Printing the Subfloats

`\ccfRenderSubFloats` iterates through the single sub-floats and renders them in a nice row. #1 is the subfloat counter, #2 is the Component name that contains the actual contents of the sub-float, for `\ccPrefix Figure` it is `Fig`, for `\ccPrefix Table` it is `Content`.

```

332 \long\def\ccfRenderSubFloats#1#2{%
333   \leavevmode
334   \savenotes
335   \ifnum#1>\@ne\hfill\fi
336   \vtop\bgroup
337     \expandafter\hsize\csname cc@\cc@cur@cont @res@width-#1\endcsname\relax
338     \let\includegraphics\ccf@includesubgraphics
339     \leavevmode
340     \ccf@render@sub{#1}{#2}%
341   \egroup
342   \spewnotes
343 }

```

`\ccf@render@sub` renders a single sub-float. For the arguments, see `\ccfRenderSubFloats`, above.

```

344 \long\def\ccf@render@sub#1#2{%
345   \ccSubFloatCnt=#1\relax
346   \ccf@make@subcaption{top}%
347   \bgroup\strut\ccUseComp{#2}\strut\par\egroup%
348   \ccf@make@subcaption{bottom}}

```

3.5 Attribute Handlers

The following macros handle the Attributes of Float Container instances.

`\ccf@attr@class` handles the style class of the float.

`{#1}` is the value of the “class” Attribute.

```

349 \def\ccf@attr@class#1{%
350   \gdef\ccf@current@class{#1}%%
351 }

```

`\ccf@eval@class` expands the style class specific Properties.

```

352 \def\ccf@eval@class{%
353   \ccUseStyleClass{default}{\ccfCapType}
354   \ifx\ccf@current@class\relax\else
355     \ccUseStyleClass{\ccf@current@class}{\ccfCapType}%
356   \fi}

```

`\ccf@attr@pos` is the handler for determining the float position. Some float Properties and Attributes restrict and override the explicit float positions, e.g., fully rotated floats must be positioned in `p` mode (i.e., as float page).

`{#1}` is the value of the float-pos Attribute. It may be any combination of `h`, `t`, `p`, `b`; or `h!`, which means that the float is non-floating (which is equivalent to an omitted `float-pos` Attribute)

```

357 \def\ccf@attr@pos#1{%
358   \edef\ccf@floatpos{#1}%
359   \def\@tempa{h!}\ifx\ccf@floatpos\@tempa\let\ccf@floatpos\@empty\fi
360   \def\@tempa{h}\ifx\ccf@floatpos\@tempa\def\ccf@floatpos{htbp!}\fi

3.6 Handling of List-of Entries

`\ccf@generate@listof@handlers` generates handlers for listof-entries.

- #1 is the file ending
- #2 is the caption type
- #3 is the Container name

```

392 \def\ccf@generate@listof@handlers#1#2#3{%

```

`cc@listof@extract@data` The first macro that is dynamically defined, is the Component collector.

- ##1 is a numeric level that represents the order of the listof-entries
- ##2 is the caption type
- ##3 is the content of the `l@<level>` macro
- ##4 is the page number associated with that entry.

```

393 \expandafter\gdef\csname cc@#1@extract@data\endcsname##1##2##3##4{%
394   \ccSetContainer{#3}%
395   \ccEvalType[#3]{Properties}%
396   \ccDeclareComponent{ListofCaption}{-}{-}%
397   \ccDeclareComponent{ListofLegend}{-}{-}%
398   \ccDeclareComponent{ListofSource}{-}{-}%
399   \ccDeclareComponent{ListofNumber}{-}{-}%
400   \ccDeclareComponent{ListofPage}{-}{-}%
401   \ccComponent{ListofPage}{\ccUseProperty{list-of-page-face}##4}%
402   \cc@expand@l@contents{##3}{#3}{Listof}{Caption}%
403   \cc@format@number{list-of-}{Listof}{##1}%
404 }%

```

`\cc@listof@print@entry` The second dynamically defined macro is the entry renderer. It applies the Listof properties and selects the components to be printed. ##1 is the caption type of the float.

```

405 \expandafter\gdef\csname cc@#1@print@entry\endcsname##1{%
406   \bgroup
407   \ccUseHook{list-of-before-hook-##1}%

```

```

483 \ccUseProperty{sub-number-after}%
484 \endgroup}%
485 \ccComponent{Number}{\ccUseProperty{sub-number-format}}%
486 }

```

Generation of L^AT_EX Labels

`\ccfCreateLabel` creates labels

```

487 \def\ccfCreateLabel{%
488 \ccIfComp{Number}
489 { \def\cc@fallback@anchor{%
490 \ccGobble
491 \ccdefFromComp\@currentlabel{Number}%
492 \ccdefFromComp\@currentlabelname{ListofCaption}}%
493 \def\cc@labelname@comp{Caption}}
494 { \def\cc@fallback@anchor{\phantomsection}}%
495 \expandafter\ccCreateLabel\expandafter{\ccfCapType}}

```

3.8 Processing the Float

Sizes, Spacing and Margins

`\ccf@set@hsize` calculates the available maximum width for the float contents and captions according to the values of the `margin-right` and the `margin-left` properties.

```

496 \def\ccf@set@hsize{%
497 \expandafter\ccf@sub@sep\ccUseProperty{sub-float-sep}\relax%
498 \global\ccf@total@width=\hsize\relax
499 \expandafter\ccf@margin@l\ccUseProperty{margin-left}\relax
500 \expandafter\ccf@margin@r\ccUseProperty{margin-right}\relax
501 \expandafter\ccf@margin@i\ccUseProperty{margin-inner}\relax
502 \expandafter\ccf@margin@o\ccUseProperty{margin-outer}\relax
503 \ccf@set@margins
504 \global\advance\ccf@total@width-\ccf@margin@r\relax
505 }

```

`\ccf@set@margins` realises inner and outer margins via the left and right margins.

```

506 \def\ccf@set@margins{%
507 \ccTestPage
508 \if@cc@odd
509 \advance\ccf@margin@l\ccf@margin@i
510 \advance\ccf@margin@r\ccf@margin@o
511 \else
512 \advance\ccf@margin@l\ccf@margin@o
513 \advance\ccf@margin@r\ccf@margin@i
514 \fi
515 }

```

Processing the Contents of the Float Environment

`\ccf@process` calculates the dimensions of the content of a float environment (including captions and spacing) and eventually prints the contents using the `float-render` and `subfloat-render` Properties.

```

516 \def\ccf@process{%
517 \ifx\ccf@has@capt@top\empty\leavevmode\fi

```

```

581 }

```

3.9 Caption mechanism

`\ccf@test@caption` tests if the current sub-float has any top or bottom caption that needs to be printed.

- #1 is the value of the sub-float counter
- #2 indicates if the caption belongs to the whole float (empty) or a sub-float (sub)
- #3 top or bottom

We compare the caption of the current `\SubCounter` level with a caption of a non-existing, negative, float level in case there is non-expandable material hard-coded into the `caption-#3` Property. If we were to compare the width of the `\hbox` with `\z@`, this scenario would give us false positives.

Warning: Long captions can cause the `\hbox`'s width to exceed `\maxdimen`. To avoid L^AT_EX errors in this case, we compare `sp` instead of `pt`. This, however, means that if the difference is less than 1pt, the test fails and no caption is printed!

```

581 \def\ccf@test@caption#1#2#3{%
582 \cc@is@finalfalse
583 \setbox\cc@tempboxa\hbox{\ccGobble\ccSubFloatCnt=0#1\relax\ccUseProperty{#2caption-#3}\relax}%

4 Generic User-Level Float Containers

`\ccDeclareFloat` is a user-level macro used to declare a new `ccFloat` environment.

- [#1] Name of the float Container from which the declared Container should inherit Properties (*optional*)
- {#2} top-level name of the float environment (e.g., `\ccPrefix Table`, `\ccPrefix Figure`)
- {#3} the tagging Role (*optional*, defaults to `Div`)
- {#4} caption type (e.g., `table`, `figure`)
- {#5} list (e.g., `lot`, `lof`)
- {#6} additional Component body, use this to add to Types or introduce custom Handlers to the Float Container.

```

688 \def\ccDeclareFloat{\cc@opt@empty\ccf@declare@float}
689 \def\ccf@declare@float[#1]#2{\ifnextchar[{\@ccf@declare@float[#1]#2}{\@ccf@declare@float[#1]#2[
    Div]}}}%]
690 \long\def\@ccf@declare@float[#1]#2[#3]#4#5#6{%

```

First, we check if the Container already exists. If so, we issue an error message. May we force the style programmers learn to make use of CoCo_{TEX}'s extensive toolbox.

```

691 \ifcsdef\cc@container@#2}{%
692   \ccPackageError{Float}{%
693     {Attempt to re-define pre-existing float Container `#2'}
694     {You cannot re-define an existing float Container. Use
695 \string\ccAddToType{<Type>}{#2}{<code>} to alter the #2 container!}}{%

```

Otherwise, we declare the new Container and invoke all the Initializers.

```

696 \def\ccf@parent{#1}%
697 \ccDeclareContainer{#2}{%
698   \ccPackageInfo{Floats}{%{Declaring float `#2'}%
699   \ifx\ccf@parent\@empty
700     \ccInherit{Properties,Components,Attributes}{float}
701   \else
702     \ccInherit{Properties,Components}{\ccf@parent}
703   \fi
704   \ccDeclareType{FloatEnvInfo}{%
705     \ccSetContainer{#2}%
706     \def\ccf@capType{#4}%
707     \def\ccf@cap@list@type{#5}%
708   }% /FloatEnvInfo

```

The macro actually defines two L^AT_EX environments; a normal one for one-column floats, and a starred one for page-wide floats in two-column mode.

```

709   \ccDeclareEnv{#2}{\ccf@float}{\endccf@float}%
710   \ccDeclareEnv{#2*}{\if@twocolumn\let\ccf@do@dbl\relax\else\fi\ccf@float}{\if@twocolumn\let\
    ccf@do@dbl\relax\fi\endccf@float}%
711   \ccDeclareType{Components}{}%
712   \ccDeclareType{Properties}{}%

```

Generating the Handlers for the list-of entries and define the corresponding `l@` macros

```

713   \ccf@generate@listof@handlers{#5}{#4}{#2}%
714   \bgroup
715   \def\cc@cur@cont{#2}%
716   \cc@init@l@[list-of]{#4}{0}{#4}% Generate listof-Entries for first level floats
717   \cc@init@l@[list-of]{#5}{1}{sub#4}% Generate listof-Entries for sub-floats
718   \egroup
719   #6
720 }% /container

```

Finally, we set the Rolemap for PDF Tagging. Since ‘Figure’ and ‘Table’ are already valid Tags, we don’t need to map those.

```

721 \ccIfAlly{%
722   \ifstrequal{Table}{#2}{%
723     {\ifstrequal{Figure}{#2}{%
724       {\ccaAddRolemap{#2}{#3}}}%
725     }{}}

```

5 Image Containers

5.1 Abstract Graphics Container

Graphic is an abstract Container that represents an image file.

```

726 \ccDeclareContainer{Graphic}{%
727   \ccDeclareType{Components}{%
728     \def\cc@counted@comp@scheme##1{##1-\the\ccSubFloatCnt}%

```

Fig holds the includegraphics with the path to and the options for the actual image file.

```

729   \ccfMakeComp{Fig}%

```

AltText is the alternative text for accessibility.

```

730   \ccfMakeComp{AltText}%

```

```

731 }%
732 \ccDeclareType{Properties}{}%
733 }

```

5.2 Floating Figure Container

Figure is the user-level Container for display-style images or image clusters including their respective captions. Figures may either be placed as free-standing in-situ blocks or as floats.

```

734 \ccDeclareFloat{Figure}{figure}{lof}{%
735   \ccInherit{Properties,Components}{Graphic}%
736   \ccDeclareType{Properties}{%

```

subfloat-same-height [true|false] Whether all images in subfloats could be scaled to the same height (true) or not (false).

```

737   \ccSetProperty{subfloat-same-height}{true}%

```

subfloat-content <any>

```

738   \ccSetProperty{subfloat-content}{%
739     \ifx\ccf@no@figs\relax
740       \rule{0pt}{1pt}\rule{1pt}{0pt}%
741     \else
742       \ccUseComp{Fig}%
743     \fi}%

```

`float-render` <any> figure specific output routine.

```
744 \ccSetProperty{float-render}{\ccfFigureRender}%
```

`subfloat-render` <any> figure specific output routine for sub-floats.

```
745 \ccSetProperty{subfloat-render}{\ccfSubFigureRender}%
746 }%
747 }
```

5.3 Figure Output Routines

`\ccfFigureRender` tells the float Container how the main content Component if Figure-type Floats is to be rendered. It is called via the Property.

```
748 \def\ccfFigureRender{%
749   \bgroup
750   \ccIfAttrIsStr{\ccfCapType}{orientation}{landscape}
751   {\hsize\dimexpr\textwidth-\ccf@margin@r-\ccf@margin@l\relax}%
752   }%
753   \let\includegraphics\ccf@includesubgraphics
754   \hskip\ccf@margin@l
755   \ccWhenComp{AltText}{\ccaAddAltText{\ccUseComp{AltText}}}{%
756   \strut\ccUseComp{Fig}\strut
757   \egroup}
```

`\ccfSubFigureRender` tells the abstract float Container how the main content Component of Figure-type sub-floats are to be rendered. It is called via the Property.

```
758 \def\ccfSubFigureRender{%
759   \hskip\ccf@margin@l
760   \cc@iterate{\@tempcnta}{\@one}{\ccSubFloatCnt}{%
761   \ccfRenderSubFloats{\the\@tempcnta}{Fig}%
762   }}%
```

`\ccf@includesubgraphics` is an override of L^AT_EX's `\includegraphics` patched to adjust for maximum width and height.

```
763 \def\ccf@includesubgraphics{\cc@opt@empty\@ccf@includesubgraphics}%
764 \def\@ccf@includesubgraphics[#1]#2{%
765   \ifx\ccf@current@class\relax
766     \def\@igopts{max width=\hsize,max height=\vsize}%
767   \else
768     \def\@igopts{width=\hsize}%
769   \fi
770   \if!#1!\else
771     \def\@igopts{#1,width=\hsize}%
772   \fi
773   \gdef\ccf@fig@path{#2}%
774   \if@cc@is@final\ccaAddPlacement{Block}\fi%
775   \expandafter\ccf@ltx@includegraphics\expandafter[\@igopts]{#2}%
776 }
```

5.4 Inline Figures

Inline Figure Container

`InlineFigure` is the user-level Container for inline graphics (e. g., images in tables or symbols inside the main text body). Note that this Container is *not* derived from the abstract `float` Container. Also, there is no \LaTeX environment for that Container but a simple macro.

```
777 \ccDeclareContainer{InlineFigure}{%
778   \ccInherit{Properties,Components}{Graphic}%
779   \ccDeclareType{Attributes}{}%
780   \ccDeclareType{Properties}{%}
```

`smash` [true|false] whether the image is allowed to stretch the line it is in (false) or not (true) if the height exceeds `\baselineskip`.

```
781   \ccSetProperty{smash}{false}
```

`vertical-align` [top|middle|bottom] the vertical alignment of the inline image relative to the baseline of the surrounding text. If the value is `bottom`, the bottom border of the image is aligned with the baseline, `top` aligns the top border of the image at baseline + `\ht\strutbox`, `middle` centers the image at baseline + $0.5 \times \text{ht}\backslash\text{strutbox}$.

```
782   \ccSetProperty{vertical-align}{bottom}
```

`float-render` <any> specific output routine for inline figures

```
783   \ccSetProperty{float-render}{\ccUseComp{Fig}}
784 }%
785 }
```

Inline Figure User Macro

`\ccInlineFigure` is the Handler for an inline figure's main content Component.

[#1] is the attribute list for the figure

{#2} is the Container Body

```
786 \def\ccInlineFigure{\ccopt@empty\cc@inline@figure}
787 \def\cc@inline@figure[#1]#2{%
788   \begingroup
789     \ccSetContainer{InlineFigure}%
790     \def\ccfCapType{figure}%
791     \ccToggleCountedConditionals
792     \ccEvalType{Properties}%
793     \ccEvalAttributes[\ccfCapType]{#1}%
794     \ccf@eval@class
795     \ccEvalType{Components}%
796     \ignorespaces
797     #2%
798     \ccSubFloatCnt=\z@\relax
799     \bgroup
800       \ccaStructStart{Figure}%
801       \ccWhenComp{AltText}{\ccaAddAltText{\ccUseComp{AltText}}}%
802       \ccUseProperty{float-render}%
803       \ccaStructEnd{Figure}%
804     \egroup
805     \ccf@debug%
806     \ccf@store@dimens
807   \endgroup
808 }
809 \csdef{\ccPrefix InlineFigure}{\ccInlineFigure}%
```

6 Table Containers

6.1 The Abstract Tabular Container

CoCoT_EX's float module supports the three basic Standard L^AT_EX tabular environments (*tabular*, *tabularx* and *tabulary*) as well as *htmltab* from the *htmltabs* package. For the measuring to work correctly, we need to render the tables as a whole and store the result inside `\ccf@floatbox` for measuring and further processing.

Tabular is an abstract Container that represents raw table data. Its main purpose is to provide a unified interface to patch some of L^AT_EX's standard *tabular* environments, as well as the *htmltab* environment, if the *htmltabs* package is loaded.

```
810 \ccDeclareContainer{Tabular}{%
811   \ccDeclareType{Properties}{}%
812   \ccDeclareType{Components}{%
813     \ccf@reserve@tabular
814   }%
815 }
```

`\ccf@reserve@tabular` is a shell macro that temporarily stores the default macro definitions for various tabular environments and patches them such that the contents are stored inside the `\ccf@floatbox`. The macro is called at the very beginning of the Table Container's environment and the patches only hold inside that environment. Thus, all tabular environments can be used in their vanilla state outside CoCoT_EX's Table environments.

```
816 \def\ccf@reserve@tabular{%
817   \ccf@reserve@tab{%
818     \ccf@reserve@tab{x}%
819     \ccf@reserve@tab{y}%
820     \ccf@reserve@htmltab%
821   }
```

`\ccf@reserve@tab` stores the default definitions for a specific vanilla-L^AT_EX tabular environment and re-defines the macros in a way that the tabulars are stored in the `\ccf@floatbox` instead of printed onto the page.

```
822 \def\ccf@reserve@tab#1{%
823   \csletcs{orig@tabular#1}{\tabular#1}%
824   \csletcs{orig@endtabular#1}{\endtabular#1}%
825   \csdef{\tabular#1}{%
826     \global\setbox\ccf@floatbox
827     \vbox\bgroup
828     \if!#1!\else
829       \let\tabular\orig@tabular
830       \let\endtabular\orig@endtabular
831     \fi
832     \csname orig@tabular#1\endcsname}%
833   \csdef{\endtabular#1}{\csname orig@endtabular#1\endcsname\egroup}%
834 }
```

6.2 The User-Level Table Container

Table is a user-level Container for display-style tables including their captions. They may either be placed as free-standing in-situ blocks or as floats.

```
835 \ccDeclareFloat{Table}{table}{lot}{%
836   \ccInherit{Properties,Components}{Tabular}%
837   \ccDeclareType{Properties}{%
```

```

838 \ccSetProperty{subcaption-valign-top}{bottom}%
839 \ccSetProperty{subfloat-content}{%
840   \PackageError{coco-floats.sty}
841   {ccSubFloat does not support sub-tables (yet)!}
842   {You cannot yet use a tables within the `ccSubFloat'!}%
843 }%
844 \ccSetProperty{float-render}{\ccfTableRender}%
845 \ccSetProperty{subfloat-render}{\ccfSubTableRender}%
846 }%
847 }

```

`\ccf@reserve@htmltab` special handler for tables using the `htmltabs` package:

```

848 \AtBeginDocument{%
849   \@ifpackageloaded{htmltabs}{%
850     \def\ccf@reserve@htmltab{%
851       \let\ccf@add@style\@empty
852       \ifx\ccf@floatpos\@empty
853         \expandafter\ifx\csname \ccPrefix Float\the\ccf@int@cnt Captop\endcsname\relax\else
854         \htInitSkip\csname \ccPrefix Float\the\ccf@int@cnt Captop\endcsname
855         \advance\htInitSkip\ccf@sep@top%
856       \fi
857       \expandafter\ifx\csname \ccPrefix Float\the\ccf@int@cnt Capbottom\endcsname\relax\else
858       \htAddToBottom\csname \ccPrefix Float\the\ccf@int@cnt Capbottom\endcsname
859       \advance\htAddToBottom\ccf@sep@bottom%
860     \fi
861     \else
862     \def\ccf@add@style{;break-table:false;}%
863     \fi
864     \edef\cc@tempa{margin-left:\ccf@margin@l\ccf@add@style}%
865     \expandafter\htAddStyle\expandafter{\cc@tempa}%
866     \global\setbox\htTableBox\box\voidb@x
867     \let\htOutputTable\relax
868   }}{\let\ccf@reserve@htmltab\relax}%
869 }

```

6.3 The Table Output Handler

`\ccfGetTableContent` returns the `\ccf@floatbox` if it is not un-itialized or void.

```

870 \def\ccfGetTableContent{%
871   \ifx\htTableBox\@undefined\else
872     \ifvoid\htTableBox\else
873       \let\ccf@floatbox\htTableBox%
874     \fi\fi}

```

`\ccfTableRender` is the content of the Property specific for tables.

```

875 \def\ccfTableRender{%
876   \ccfGetTableContent
877   \ccComponent{Content}{\unvbox\ccf@floatbox}%
878   \ccUseComp{Content}%
879   \ifx\ht@structID@Thead\@undefined\else\ccaMoveStruct{\ht@structID@Thead}\fi%
880   \ifx\ht@structID@TBody\@undefined\else\ccaMoveStruct{\ht@structID@TBody}\fi%
881   \ifx\ht@structID@TFoot\@undefined\else\ccaMoveStruct{\ht@structID@TFoot}\fi%
882   \par\if\ccf@break@capt\else\nopagebreak\fi
883   \vskip\dp\strutbox
884 }

```

`\ccfSubTableRender` Is the content of the table-specific Property (**Note** that table sub-floats aren't allowed yet, so this definition is un-used at the moment. TeX will crash with an error message before this Property is ever expanded.)

```

885 \def\ccfSubTableRender{%
886   \cc@iterate{\@tempcnta}{\@ne}{\ccSubFloatCnt}{%
887     \ccfGetTableContent
888     \@cc@is@finalfalse
889     \ccComponent{Content}{\unvbox\ccf@floatbox}%
890     \@cc@is@finaltrue
891     \ccfRenderSubFloats{\the\@tempcnta}{Content}%
892   }}

```

7 Other Float-Related Macros

`\ccFloatBarrier` can be used to force all pending floats to be printed at the next shipout.

```

893 \def\ccFloatBarrier{\AtBeginShipoutNext{\clearpage}}

```

Output Driver for the `coco-floats.sty`.

```
</floats>
```

62 }
63 \expandafter\pdfpageattr\expandafter{\@tempa}
64 \fi

```

Apparently, the crop package relies on old pdf dimension macros. If they aren't defined, we load the `luatex85` package and set the values of the type area by hand:

```

65 \@ifundefined{pdfpagewidth}{%
66   \RequirePackage{luatex85}
67   \pdfpagewidth\paperwidth
68   \pdfpageheight\paperheight
69 }{}

```

Setting PDF boundaries

```

70 \ifx\cc@frame@mode n\relax\else
71   \ifx\cc@frame@mode p\relax
72     \edef\stockwidth{\the\dimexpr\paperwidth+\cc@frame@@offset+\cc@frame@@offset\relax}
73     \edef\stockheight{\the\dimexpr\paperheight+\cc@frame@@offset+\cc@frame@@offset\relax}
74   \fi

```

Cropmarks and page area frames both are painted via the `crop` package.

```

Module 12

coco-lists.dtx

```
<*lists>
```

This module provides handlers for list-like environments like item lists, enumerations, glossaries and descriptions.

Note: The `coco-lists` module diverges somewhat from the other CoCoTeX modules insofar as that its main Container does not follow the CoCoTeX's usual “collect all–process later” approach, but all Properties are processed at the beginning of each Container's instances and the contents are processed as they are parsed by the `\LaTeX` interpreter, just like “reguar” L^AT_EX lists. Configuration of lists, however, follows the CoCoTeX playbook.

1 Preamble

```
23 \NeedsTeXFormat{LaTeX2e}[2018/12/01]
24 \ProvidesPackage{coco-lists}
25   [2024/03/23 0.4.1 CoCoTeX lists module]
26 \RequirePackage{coco-common}
```

1.1 Package Options

If the `replace` option is set, LaTeX's default lists are replaced by `coco-lists` module. This effects L^AT_EX's `enumerate`, `itemize`, and `description` environments.

```
27 \newif\if@ccl@replace \@ccl@replacefalse
28 \DeclareOptionX{replace}{\global\@ccl@replacetrue}%
```

The option `inherit` defines how nested lists inherit their properties. Currently, there are two ways: `common`: All nested lists of the same type inherit only from the same, generic type definition; `conseq`: nested lists of the same type inherit from the next-higher level list of the same type, and from the generic type definition.

For example, if `inherit=common`, 3rd level `itemize` and 2nd level `itemize` both inherit only the property values of the same generic `itemize` list type. If `inherit=conseq`, 3rd level inherits the property lists from 2nd level `itemize`.

Since inheritance is a transitive relation, 3rd level `itemize` will ultimately also inherit the Properties from generic `itemize`, but in contrast to `common`, `conseq` allows 2nd level `itemize` to override some Properties of generic `itemize`, which will be propagate down to 3rd level `itemize`, while with `inherit=common`, the override on 2nd level `itemize` would have no effect on 3rd level `itemize`.

`\ccl@ih@common` is used for comparisons. It represents the `inherit=common` package option.

```
29 \def\ccl@ih@common{common}
```

`\ccl@ih@conseq` is used for comparisons. It represents the `inherit=conseq` package option.

```
30 \def\ccl@ih@conseq{conseq}%
```

`\ccl@str@local` is a string for comparison. It represents the `nesting=local` option.

```
31 \def\ccl@str@local{local}%
```

`\ccl@str@global` is a string for comparison. It represents the `nesting=global` option.

```
32 \def\ccl@str@global{global}%
```

`\ccl@inherit` stores the value of the `inherit` package option.

```
33 \let\ccl@inherit\ccl@ih@common
34 \define@choicekey{coco-lists.sty}{inherit}[\@ccl@inherit\nr]{conseq,common}{%
35   \ifcase\nr\relax% conseq: nested lists of the same type inherit only from the previous level
36   \global\let\ccl@inherit\ccl@ih@conseq
37   \fi
38 }
```

`\ccl@nesting` The nesting option sets whether the nesting level of a list should be counted list-specific (value `local`), or globally (value `global`, default).

```
39 \let\ccl@nesting\ccl@str@global
40 \define@choicekey{coco-lists.sty}{nesting}[\@ccl@nesting\nr]{local,global}{%
41   \ifcase\nr\relax% local
42   \global\let\ccl@nesting\ccl@str@local
43   \fi
44 }
```

```
45 \ProcessOptionsX
```

2 The List Container

`List` is the most abstract Container for lists.

```
46 \ccDeclareContainer{List}{%
```

2.1 List Properties

```
47 \ccDeclareType{Properties}{%
```

List Boundaries

`before-list` <any> is expanded at the very beginning of a (nested) list.

```
48 \ccSetProperty{before-list}{% at the very beginning of each (nested) list
49   \if@noskipsec \leavevmode \fi
50   \ifvmode\else
51   \unskip \par
52   \fi
```

`<L>` is the opening List tag

```
53 \ccaStructStart{L}%
54 }
```

`after-list` <any> is expanded at the very end of a (nested) list. By default, it calls the `after-item` Property. </L> is the closing List tag

```
55 \ccSetProperty{after-list}{%
56 \ccUseProperty{after-item}%
57 \ccaStructEnd{L}% end tag for the (nested) list
58 }%
```

List Margins

`margin-top` <skip> is the vertical skip at the beginning of each List instance.

```
59 %% list margins
60 \ccSetProperty{margin-top}{\z@}%
```

`margin-bottom` <skip> is the vertical skip at the end of each List instance.

```
61 \ccSetProperty{margin-bottom}{\z@}% vertical space before the list.
```

`margin-left` [auto|<skip>] is the horizontal space to the left of each list instance, from left boundary of the page area. `auto` means that the left margin is set to the width of widest label + `prev-margin-left`. The value is passed through `\dimexpr`, so basic arithmetic is allowed.

```
62 \ccSetProperty{margin-left}{\csname leftmargin\@roman\cclCurDepth\endcsname-\ccUseProperty{
label-sep}+\ccUseProperty{prev-margin-left}}%
```

`margin-left` <dimen> is the maximum space reserved for a list item's label.

```
63 \ccSetProperty{max-label-width}{.33\textwidth}%
```

`margin-right` <skip> is the right margin of the list instance.

```
64 \ccSetProperty{margin-right}{\z@}% horizontal space to the right of each list item
```

Between List Items

`item-sep` <skip> is the vertical space between two adjacent list items. Note that the real value value is advanced by the value of the `par-skip` Property.

```
65 \ccSetProperty{item-sep}{\z@}%
```

`after-indent` [true|false] determines whether the text paragraph after the (top-level) list is indented (`true`) or not (`false`).

```
66 \ccSetProperty{after-indent}{false}%
```

`at-begin-item-body` <any> is expanded right at the beginning of a new item body and sets the `<LBody>` tag.

```
67 \ccSetProperty{at-begin-item-body}{\ccaVstructStart{LBody}}%
```

`at-end-item-body` <any> is expanded at the very end of an item body, but before the final `\par`. By default, it only sets the closing `</LBody>` tag.

```
68 \ccSetProperty{at-end-item-body}{\ccaVstructEnd{LBody}}%
```

`after-item` <any> is expanded after each list item. It calls the `at-end-item-body` Property and closes the item's final paragraph as well as the `` tag.

```
69 \ccSetProperty{after-item}{%
70 \ccUseProperty{at-end-item-body}%
71 \ccaVstructEnd{LI}% Close list item tags
72 \par}%
```

`before-item` <any> is called at the very beginning of each list item. If the current item is the first item, the `\ifcclFirst` conditional is set to false. All non-first items of the same List instance call the `after-item` Property and add a vertical skip of `item-sep` amount.

After that, the paragraph formatting parameters for the list-item `par-indent`, `par-skip`, and `par-fill-skip`, as well as the starting `` tag are set.

```
73 \ccSetProperty{before-item}{%
74 \ifcclFirst
75 \global\cclFirstfalse
76 \else
77 \ccUseProperty{after-item}%
78 \vskip\ccUseProperty{item-sep}%
79 \fi
80 \parindent\ccUseProperty{par-indent}\relax%
81 \parskip\ccUseProperty{par-skip}\relax%
82 \parfillskip\ccUseProperty{par-fill-skip}\relax%
83 \noindent
84 \leavevmode
85 \ccaVstructStart{LI}% Start tag for a list item
86 }%
```

`item-offset` <any> calculates `\cclItemIndent` from the `indent` and `label-sep` Properties and sets the horizontal offset of the first line of the list item. After that, the value of the macro is unsigned.

```
87 \ccSetProperty{item-offset}{%
88 \cclItemIndent\ccUseProperty{indent}%
89 \advance\cclItemIndent\dimexpr-\ccUseProperty{label-sep}\relax
90 \hskip\cclItemIndent\relax%
91 \ifdim\ccUseProperty{indent}>\z@
92 \cclItemIndent\ccUseProperty{indent}%
93 \else
94 \cclItemIndent-\ccUseProperty{indent}%
95 \fi
96 }%
```

`par-indent` <skip> is the indent of the first line of a *new* paragraph inside a list item

```
97 \ccSetProperty{par-indent}{\parindent}%
```

`par-fill-skip` <skip> is the skip at the end of the last line of each paragraph inside a list item

```
98 \ccSetProperty{par-fill-skip}{\@flushglue}%
```

`par-skip` <dimen> vertical space between two adjacent paragraphs inside the same List item

```
99 \ccSetProperty{par-skip}{\z@}%
```

Label Formatting

`label` <any> prints the `Label` component.

```
100 \ccSetProperty{label}{\ccUseComp{Label}}%
```

indent [auto|auto-global|<dimen>] is the indent of each List item's first line (relative to **margin-left**).

If the value is **auto**, the real indent and left margin of a item's first line is calculated using coco-common's indentation mechanism (see Sect. 3.3 in Module Module 3). The first-line indent will thereby be calculated from the widest width of all labels of the same list type and nesting level.

Note: the value **auto-global** is allowed, but it causes *all* lists – regardless of the nesting level – to have the same left margin and indent!

```
101 \ccSetProperty{indent}{-\dimexpr\csname leftmargin\@roman\cclCurDepth\endcsname-\ccUseProperty{label-sep}\relax}%
```

label-sep <dimen> is the horizontal space between the label and the item body.

```
102 \ccSetProperty{label-sep}{.5em}%
```

label-face <any> is the style of the label.

```
103 \ccSetProperty{label-face}{}%
```

label-align [left|center|right] is the alignment of the label within its local **\hbox**.

```
104 \ccSetProperty{label-align}{left}%
```

label-format <any> is the format of the label. It should call the **label-face** and **label** properties and enclose the latter with **<Lbl>** and **</Lbl>**.

```
105 \ccSetProperty{label-format}{%
106 \ccUseProperty{label-face}%
107 \ccaVstructStart{Lbl}%
108 \ccUseProperty{label}%
109 \ccaVstructEnd{Lbl}%
110 }%
```

label-box <any> is the property that builds a local **\hbox** into which the **Label** Component is printed. It should respect the **label-align** Property and call **label-format**.

```
111 \ccSetProperty{label-box}{%
112 \hbox to \cclItemIndent{%
113 \ccIfPropVal{label-align}{left}{-}{\hss}%
114 \ccUseProperty{label-format}%
115 \ccIfPropVal{label-align}{right}{-}{\hss}}%
116 }%
```

item-format <any> contains material printed at the beginning of a new item. It should call the **before-item**, **item-offset**, **label-box** and **label-sep** Properties.

```
117 \ccSetProperty{item-format}{%
118 \ccUseProperty{before-item}%
119 \ccUseProperty{item-offset}%
120 \ccUseProperty{label-box}%
121 \hskip\ccUseProperty{label-sep}%
122 }%
123 }%
```

2.2 List Components

```
124 \ccDeclareType{Components}{%
```

`Label` represents a List item's local label.

```

125   \ccDeclareComponent{Label}%
126   }%
127   \ccDeclareEnv{cc@list}{\endcc@list}%
128 }

```

3 Declaring List Types

List Types are the next layer of abstraction for lists. This layer distinguishes numbered from unnnumbered and description lists.

`\DeclareListType` declares a new list type. #1 is the name of the list type, #2 is the declaration body. Each new list type should declare at least an Attribute handler and a Label handler. #3 is a list of type specific properties that are appended to the generic list's property list.

```

129 \long\def\ccDeclareListType#1#2#3{%

```

`\DeclareAttributeHandler` declares a new handler for a list's attributes. ##1 is the definition body.

```

130   \def\DeclareAttributeHandler##1{\csdef{ccl@eval@attrs@#1}{##1}}%

```

`\DeclareLabelHandler` declares a new handler for each item's label. ##1 is the definition body. It should fill the Label Component with content in case the optional argument of item is omitted.

```

131   \def\DeclareLabelHandler##1{\csdef{ccl@make@label@#1}{##1}}%

```

```

132   \ccDeclareContainer{#1List}{%
133     \ccInherit{Components,Properties}{List}%
134     \ccDeclareType{Properties}{%

```

`list-type` <any> holds the name of the list type.

```

135     \ccSetProperty{list-type}{#1}%

```

```

136     #3%
137   }%
138   \ccDeclareEnv[#1-list]{\cc@list}{\endcc@list}%
139   }%
140   #2%
141 }

```

4 Declare Lists

The next layer of abstraction is the user-level List container. Each List container must be assigned to a list type from which it will inherit its type-specific properties.

`\ccDeclareList` defines a new list. #1 is the name of the list environment (sans `\ccPrefix`), #2 is the list type, #3 is the list-specific Property list.

```

142 \def\ccDeclareList#1#2#3{%
143   \csxdef{cc@cur@depth@#1}{\z@}%
144   \ccDeclareContainer{#1}{%
145     \ccInherit{Properties,Components}{#2List}%
146     \ccDeclareType{Properties}{#3}%
147     \ccDeclareEnv{#1}{\cc@list}{\endcc@list}%
148   }%
149   \ccDeclareNested{#1}{\z@}{#3}%
150 }

```

`\ccDeclareNested` can be used to declare Property overrides for nested lists. #1 is the list name, #2 is the nesting depth (#2th nesting level means that the Properties are used for the $n + 1$ -th list of the same name), #3 is the Property list.

```

151 \def\ccDeclareNested#1#2#3{%
152   \@tempcnta=#2\relax
153   \ifx\@tempcnta<\@ne\relax
154     \ccPackageError{lists}{Nesting}{Invalid nesting level!}{You cannot declare nesting levels
155       less than 1!}%
156   \fi
157   \advance\@tempcnta\@ne\relax
158   \ccDeclareContainer{#1-\the\@tempcnta}{%
159     \ifcsdef{cc@container@#1}
160       {\ccInherit{Properties,Components}{#1}}
161       {\ccPackageError{lists}{Inheritance}
162         {List `#1' undefined!}
163         {You need to define the list `#1' before you can declare nested list overrides!}}%
164     \ccDeclareType{Properties}{#3}%
165   }%

```

We want to count each list type separately to ensure the correct item label is printed, but we also need to keep within the global nesting level limit. Therefore, we set two internal counters, one for the overall nesting level, and another one for each list type. Note that the latter is a macro, not a counter register.

`\ccl@depth` is the counter for the overall nesting level.

```

166 \newcount\ccl@depth

```

`\ccl@item@cnt` is the internal counter for the items within a (nested) list level.

```

167 \newcount\ccl@item@cnt

```

`\ifcclFirst` is true as long as the first item of a list is processed.

```

168 \newif\ifcclFirst \cclFirsttrue

```

`\ccl@advance@depth` is a helper macro to advance both the global list nesting level, as well as the list Container specific nesting level. #1 is the amount by which both counters should be advanced.

```

169 \def\ccl@advance@depth#1{\csname ccl@advance@depth@\ccl@nesting\endcsname{#1}}

```

`\ccl@advance@depth@global` is called when the nesting level should be counted for all lists equally without respecting the list type.

```

170 \def\ccl@advance@depth@global#1{%
171   \edef\cclPrevDepth{\the\ccl@depth}%
172   \global\advance\ccl@depth#1\relax
173   \edef\cclCurDepth{\the\ccl@depth}%
174 }

```

`\ccl@advance@depth@local` is called when the nesting level should be counted for each list type individually.

```

175 \def\ccl@advance@depth@local#1{%
176   \letcs\cclPrevDepth{cc@cur@depth@cc@cur@cont}%
177   \expandafter\@tempcnta\csname cc@cur@depth@cc@cur@cont\endcsname\relax
178   \advance\@tempcnta#1\relax
179   \csxdef{cc@cur@depth@cc@cur@cont}{\the\@tempcnta}%
180   \edef\cclCurDepth{\csname cc@cur@depth@cc@cur@cont\endcsname}%
181   \global\advance\ccl@depth#1\relax
182 }

```

`\cclItemIndent` stores the actual calculated indent of an List item's first line.

```

183 \newskip\cclItemIndent

```

`\cclTopID` is a counter that stores a unique number for each top-level List Instance. It is used to calculate the margins of both top-level items and items of nested lists.

```

184 \newcount\cclTopID \cclTopID\z@ \relax

```

`\cclID` stores a unique “identifier” number for each list, irrespective their nesting levels.

```

185 \newcount\cclID \cclID\z@ \relax

```

An internal global counter register `\ccl@total@list@cnt` is used to count the overall number of opening lists. Currently, the global ID of each list is unused.

```

186 \newcount\ccl@total@list@cnt \ccl@total@list@cnt\z@ \relax

```

`\ccl@incr@count` stores the current list ID counter in a nesting-depth specific macro `ccl@prev@cnt@the\ccl@depth`, advances the global internal list counter by one, and sets the publicly available counter `\cclID` to the resulting value. Also, if the nesting level is 1, the `\cclTopID` counter is incremented.

```

187 \def\ccl@incr@count{%
188   \csxdef{ccl@prev@cnt@the\ccl@depth}{\the\cclID}%
189   \global\advance\ccl@total@list@cnt\@ne \relax
190   \global\cclID\ccl@total@list@cnt \relax
191   \ifnum\cclCurDepth=\@ne \relax
192     \global\advance\cclTopID\@ne \relax
193   \fi
194 }

```

`\ccl@decr@count` resets the list counter for the next lower nesting level, whenever a nested list is closed.

```

195 \def\ccl@decr@count{%
196   \global\cclID\csname ccl@prev@cnt@the\ccl@depth\endcsname \relax
197 }

```

4.1 The List Environment

List environments have the same name as their respective containers (preixed by the `\ccPrefix`). However, they all call the low-level macros `\cc@list` and `\endcc@list`.

`\cc@list` is begin macro for the generalized coco-list environment. #1 is the attribute list of the environment.

```
198 \def\cc@list{\cc@opt@empty\cc@list}
199 \def\@cc@list[#1]{%
200   \ccl@advance@depth\@ne%
201   \ccl@incr@count%
202   \edef\ccl@cur@cont{\cc@cur@cont-\cclCurDepth}%
203   \global\cclFirsttrue
```

If the nesting goes deeper than the style programmer anticipated:

```
204 \ifcsdef{cc@container@\ccl@cur@cont}{%
205   {\ifx\ccl@inherit\ccl@ih@common
206     \let\ccl@cur@cont\cc@cur@cont%
207     \else
208       \global\csletcs
209         {cc@type@Properties@\cc@cur@cont-\cclCurDepth}
210         {cc@type@Properties@\cc@cur@cont-\cclPrevDepth}%
211       \fi}%
```

Horizontal margin Properties from the previous nesting level are stored so that the nested lists can use them.

```
212 \edef\ccl@leftskip{\the\dimexpr\leftskip\relax}%
213 \edef\ccl@rightskip{\the\dimexpr\leftskip\relax}%
```

`prev-margin-left <skip>` stores the left margin of the next higher list level (i. e., the left margin of the list item that the current list is nested into)

```
214 \ccSetPropertyX{prev-margin-left}{\ccl@leftskip}%
```

`prev-margin-right <skip>` stores the superior list item's right margin.

```
215 \ccSetPropertyX{prev-margin-right}{\ccl@rightskip}%
216 \ccEvalType[\ccl@cur@cont]{Properties}%
```

`\ccl@list@type` locally stores the current value of the `list-type` Property.

```
217 \edef\ccl@list@type{\ccUseProperty{list-type}}%
```

Processing of the optional argument.

```
218 \cclUseAttributeHandler{#1}%
```

The exact values of the margins are calculated.

```
219 \cclCalculateMarginLeft%
220 \cclCalculateVMargin{top}%
221 \cclCalculateVMargin{bottom}%
```

`\Item` is a used to separate the single items of a list.

```
222 \csdef{\ccPrefix Item}{\cc@opt@empty\ccl@item}%
223 \def\ccl@item[##1]{%
224   \edef\ccl@item@label{##1}%
```

```

225 \ifx\ccl@item@label\@empty
226 \cclUseLabelHandler%
227 \else
228 \ccComponent{Label}{##1}%
229 \fi

```

`\item` If default L^AT_EX macros are replaced per package option, `\item` is made into a copy of the local definition of `\ccPrefix Item`.

Warning: this might be dangerous when the User tries to embed something inside a CoCoT_EX list that uses L^AT_EX's standard `\list` or `\trivlist` environments!

```

244 \if@cc@replace\letcs\item{\ccPrefix Item}\fi%

```

Up to this point, we only managed Properties. From this point forward, we actually print the list. We start by using the `before-list` Property.

```

245 \ccUseProperty{before-list}%

```

then, we add the top vertical skip by `int-margin-top` amount.

```

246 \ccUseProperty{int-margin-top}%

```

and set the left and right margins using the `margin-left`, `label-sep` and `margin-right` Properties.

```

248 \rightskip\dimexpr\ccUseProperty{margin-right}\relax%
249 }

```

`\endcc@list` is called at the end of each List Container's respective environment. It basically calls the `after-list` Property one last time, decrements the depth counter(s) and adds the `int-margin-bottom` vertical skip.

```

250 \def\endcc@list{%
251 \ccUseProperty{after-list}%
252 \ccl@decr@count%
253 \ccl@advance@depth\m@ne%
254 \ccUseProperty{int-margin-bottom}%

```

If the List is not nested, we eventually evaluate the `after-indent` Property.

```

255 \ifnum\cclCurDepth=\z@\relax
256 \ccIfPropVal{after-indent}{false}{%
257 \global\@afterindentfalse
258 \aftergroup\cc@afterbox}%
259 \fi
260 }

```

`\cclCalculateVMargin` generates a macro that sets the internal margin Properties of the (nested) list. #1 is the orientation (`top` or `bottom`).

```

261 \def\cclCalculateVMargin#1{%
262   \ifdim\ccUseProperty{margin-#1}=\z@\relax
263     \ccSetProperty{int-margin-#1}{\relax}%
264   \else
265     \ccSetProperty{int-margin-#1}{\addvspace{\ccUseProperty{margin-#1}}}%
266   \fi
267 }
```

`\cclCalculateLeftMargin` generates the value that `\leftskip` is set to.

```

268 \def\cclCalculateMarginLeft{%
269   \ifcsdef{cc-list-\the\cclTopID-number-maxwd}
270     {\ccSetPropertyVal{number-width-max}{\csname cc-list-\the\cclTopID-number-maxwd\endcsname}}
271     {\ccSetPropertyVal{number-width-max}{1sp}}%

274       -maxwd\endcsname}}
275     {\ccSetPropertyVal{number-width-level-max}{1sp}}%
276   \cc@get@indent[\ccl@calc@margin@left]{\the\cclTopID}%
277 }
```

`\ccl@calc@margin@left` is an override for coco-common's `\cc@calc@margin@left` specific for lists. According to `\cc@calc@margin@left`'s argument structure, #1 is the internal Property prefix, and #2 is the current value of the list depth counter. However, since we already stored the left margin of the previous depth level in the internal `prev-margin-left` Property, we can gobble both arguments.

```

277 \def\ccl@calc@margin@left#1#2{%
278   \@tempdima=\ccUseProperty{prev-margin-left}\relax%
279   \ccSetPropertyX{margin-left}{\the\dimexpr\@tempdima-\ccUseProperty{indent}\relax}%
280 }
```

4.2 Unpacking the List Type-Specific Handlers

The caller macros for the two list type-specific Handlers for Attributes and Labels are defined here. They do some basic exception catching and then call the Handlers themselves if no error is detected.

`\cclUseLabelHandler` calls the list type specific Label handler to generate a label accordingly in cases where `\item` omits the optional argument.

```

281 \def\cclUseLabelHandler{%
282   \expandafter\ifx\csname ccl@make@label@\ccl@list@type\endcsname\relax
283     \ccPackageError{lists}{type}
284     {List type '\ccl@list@type' does not provide a Label Handler.}
285     {Make sure that the body of \ccl@list@type's declaration contains a \string\
286       DeclareLabelHandler.}
287   \else
288     \csname ccl@make@label@\ccl@list@type\endcsname
289   \fi
290 }
```

`\cclUseAttributeHandler` checks if the list type specific attribute handler exists and applies it to the attribute list #1.

```

290 \def\cclUseAttributeHandler#1{%
291   \ccParseAttributes{\cc@cur@cont-\cclCurDepth}{#1}%
292   \expandafter\ifx\csname ccl@eval@attrs@\ccl@list@type\endcsname\relax
293   \ccPackageError{Lists}{Type}
294     {List type '\ccl@list@type' does not provide an Attribute Handler.}
295     {Make sure that the body of \ccl@list@type's declaration contains a \string\
      DeclareAttributeHandler.}
296   \else
297     \csname ccl@eval@attrs@\ccUseProperty{list-type}\endcsname
298   \fi
299 }

```

5 Default List Types

Vanilla CoCoT_EX supports three list types: numbered lists (corresponds to L^AT_EX's *enumerate* environment), unnumbered lists (*itemize*), and description lists (*description*).

5.1 Unnumbered Lists

`unnumbered` is technically an abstract child Container of the `List` parent.

```

300 \ccDeclareListType{unnumbered}{%

```

`\ccl@make@label@unnumbered` generates the `Label` Component of an unnumbered list type.

```

301   \DeclareLabelHandler{%
302     \ccComponent{Label}{\ccUseProperty{default-label}}

```

`\ccl@eval@attrs@itemize` is the handler for attributes of itemize-like list types. Currently, it does nothing.

```

303   \DeclareAttributeHandler{}}

```

Itemize-Type List Specific Properties

`default-label` <any> is a property that holds a fallback label which is used when the optional argument of `\Item` is omitted.

```

304   {\ccSetProperty{default-label}{-}}

```

Itemize-Style Default Lists

`Itemize` is the user-level unnumbered `List` Container.

```

305 \ccDeclareList{Itemize}{unnumbered}{\ccSetProperty{default-label}{\textbullet}}
306 \ccDeclareNested{Itemize}{1}{%
307   \ccSetProperty{label-face}{\normalfont\bfseries}%
308   \ccSetProperty{default-label}{\textendash}}
309 \ccDeclareNested{Itemize}{2}{\ccSetProperty{default-label}{\textasteriskcentered}}
310 \ccDeclareNested{Itemize}{3}{\ccSetProperty{default-label}{\textperiodcentered}}

```

5.2 Numbered Lists

`\ccl@item@adv` is an internal counter that holds the amount by which the counter of numbered lists should advance for each item.

```
311 \newcount\ccl@item@adv
```

`numbered` is an abstract child Container of the List parent that represents numbered lists.

```
312 \ccDeclareListType{numbered}{%
```

`\ccl@eval@attrs@numbered` is the handler for attributes specific to the enumerate-like list types.

```
313 \DeclareAttributeHandler{%
```

The attribute `step` indicates by what amount the internal counter should be advanced for each item. Defaults to +1 if none is given.

```
314 \ccIfAttr{\cc@cur@cont-\cclCurDepth}{step}{
315   {\ccl@item@adv=\expandafter\numexpr\csname cc@\cc@cur@cont-\cclCurDepth @attr@step\
      endcsname\relax}%
316   {\ccl@item@adv=\@ne}%
```

The attribute `start` indicates the initial internal counter of the items in the list. The number itself is the counter of the first item, so we need to subtract the value of `step` from the given value such that `\item` can advance it by that same value. If the attribute is not given, the internal counter is initialized to 0.

```
317 \ccIfAttr{\cc@cur@cont-\cclCurDepth}{start}{
318   {\ccl@item@cnt=\expandafter\numexpr\csname cc@\cc@cur@cont-\cclCurDepth @attr@start\
      endcsname\relax
319   \advance\ccl@item@cnt-\ccl@item@adv}%
320   {\ccl@item@cnt=\z@\relax}%
321 }
```

`\ccl@make@label@numbered` is the `Label` handler of a numbered list type.

```
322 \DeclareLabelHandler{%
323   \advance\ccl@item@cnt \ccl@item@adv\relax
324   \expandafter\ifx\csname ccl@label@type@\ccUseProperty{enum-type}\endcsname\relax
325   \ccPackageWarning{lists}{type}{Enum type \ccUseProperty{enum-type} is unknown, revert to
      numeric counters!}
326   \let\ccl@label\ccl@label@type@arabic%
327   \else
328   \letcs\ccl@label{\ccl@label@type@\ccUseProperty{enum-type}}%
329   \fi
330   \ccComponent{Label}{\ccl@label{\ccl@item@cnt}}
331 }%
```

```
332 }{%
```

Numbered List-Specific Properties

New Properties

`enum-type` [`arabic`|`roman`|`Roman`|`Alph`|`alph`] controls how the item counter is rendered when it is not given explicitly with the optional argument of `\item`. The default values are borrowed from LaTeX's default enumerate types and defined below.

```
333 \ccSetProperty{enum-type}{arabic}%
```

Properties with Deviating Default Values

By default, numeric `Label` are followed by a period to accommodate L^AT_EX customs.

```
334 \ccSetProperty{label}{\ccUseComp{Label}.}}
```

Available Counting Styles

`\ccl@label@type@arabic` transforms the value of the following (implicit) counter to arabic numerals.

```
335 \def\ccl@label@type@arabic{\@arabic}
```

`\ccl@label@type@roman` transforms the value of the following (implicit) counter to lower case roman numerals.

```
336 \def\ccl@label@type@roman{\@roman}
```

`\ccl@label@type@Roman` transforms the value of the following (implicit) counter to upper case roman numerals.

```
337 \def\ccl@label@type@Roman{\@Roman}
```

`\ccl@label@type@alph` transforms the value of the following (implicit) counter to lower case alphabetic letters.

```
338 \def\ccl@label@type@alph{\@alph}
```

`\ccl@label@type@Alph` transforms the value of the following (implicit) counter to upper case alphabetic letters.

```
339 \def\ccl@label@type@Alph{\@Alph}
```

Enumerate-Style Default Lists

`Enumerate` is the user-level Container for numbered `List` Containers.

```
340 \ccDeclareList{Enumerate}{numbered}{%
341 \ccDeclareNested{Enumerate}{1}{% (
342 \ccSetProperty{label}{\ccUseComp{Label}}}%
343 \ccSetProperty{enum-type}{alph}}%
344 }
345 \ccDeclareNested{Enumerate}{2}{\ccSetProperty{enum-type}{roman}}
346 \ccDeclareNested{Enumerate}{3}{\ccSetProperty{enum-type}{Alph}}
```

5.3 Description Lists

`text` is an abstract child Container of the List parent used for `description`-like list types.

```
347 \ccDeclareListType{text}{%
```

`\ccl@eval@attrs@text` is the handler for the attributes of description-like list types.

```
348 \DeclareAttributeHandler{%
349 \ccIfAttr{\cc@cur@cont-\cclCurDepth}{width}
350 {\ccSetPropertyVal{min-margin-left}{\expandafter\dimexpr\csname cc@\cc@cur@cont-\
351 cclCurDepth @attr@width\endcsname\relax}}%
352 {\ccSetProperty{min-margin-left}{2em}}%
353 \ccIfPropVal{label-growth}{down}
354 {\long\def\ccl@vbox##1{\smash{\vtop{##1}}}}
```

```

354   {\long\def\ccl@vbox##1{\vbox{##1}}}%
355 }

```

`\ccl@make@label@text` creates the label of a description-like list type.

```

356 \DeclareLabelHandler{%
357   \ccComponent{Label}{}%
358 }%

```

Description-Type Specific Properties

New Properties

`label-growth` [`up`|`down`] controls the direction labels “grow” into when they need more space than `max-label-width`. On \TeX -primitive level, it controls whether the label is put into a `\vbox` or `\vtop` with `\hsize=\cclItemIndent`.

Important note: If the `label-growth` is set to ‘down’ and the description of an item uses less lines than its label, the label *will* flow into the next item. There is no (easy) way to catch that (automatically) without destroying the possibility to nesting lists.

```

359 {\ccSetProperty{label-growth}{up}%

```

Properties with Deviating Default Values

The Properties `margin-left` and `indent` of text-type lists are by default set to `auto`.

```

360 \ccSetProperty{indent}{auto}%
361 \ccSetProperty{margin-left}{auto}%

```

To accommodate for the new `label-grow` option, the `label-box` has a conditional that switches between regular `\hbox` labels and the two `\vbox` variants described above.

```

362 \ccSetProperty{label-box}{%
363   \ifdim\ccUseProperty{label-width}<\ccUseProperty{max-label-width}\relax
364     \hbox to \cclItemIndent{%
365       \ccIfPropVal{label-align}{left}{-}{\hss}%
366       \ccUseProperty{label-format}%
367       \ccIfPropVal{label-align}{right}{-}{\hss}}%
368   \else
369     \ccl@vbox{\relax%
370       \hsize\dimexpr\cclItemIndent%
371       \leftskip\z@
372       \rightskip\z@
373       \parindent\z@
374       \leavevmode
375       \ccUseProperty{label-format}%
376       \@@par
377     }%
378   \fi
379 }%

```

Description-Type Default Lists

`Description` is the user-level Container for text type `List` Containers.

As with the standard \LaTeX `description` environment, there are no default definitions for nested Description-type lists.

```

380 \ccDeclareList{Description}{text}{%
381   \ccSetProperty{label-face}{\bfseries}
382 }

```

5.4 Replacing L^AT_EX's Default Lists

At the User's descretion (using the `replace` package option, see Sect. 1.1, above), L^AT_EX's default list environments `itemize`, `enumerate`, and `description` are re-defined to use CoCoT_EX's list mechanism, instead.

```

383 \if@ccl@replace
384   \letcs\itemize{\ccPrefix Itemize}
385   \letcs\enditemize{end\ccPrefix Itemize}
386   \letcs\enumerate{\ccPrefix Enumerate}
387   \letcs\endenumerate{end\ccPrefix Enumerate}
388   \letcs\description{\ccPrefix Description}
389   \letcs\enddescription{end\ccPrefix Description}
390 \fi

```

```
</lists>
```

Index

Numbers written in *italic* refer to the page where the corresponding entry is described; numbers underlined refer to the definition; numbers in roman refer to the pages where the entry is used.

Macro and Environment Index

In this index, the cc(®)- and module specific ccX(®)-Prefixes were omitted when sorting the entries.
